Abstract: Insects are an important human food source, especially in developing countries, because of their efficiency at converting plant foods into animal protein, and their relatively low environment impact. The present study builds on some prior research on eating insects by surveying Indian and American adults. A composite measure of insect acceptance is developed. The results confirm prior findings that Americans are more accepting of insects as a potential food than Indians, and that men are more accepting than women. Substantially more Indians than Americans consider insect ingestion a violation of a protected/sacred value, suggesting a moral objection. Attitudes to and beliefs about insects and insect consumption are decomposed through factor analysis into the same five factors in both countries: Benefits, Risks, Disgust, Religion, and Suffering. Multiple regression indicates that for Americans, Disgust is the major predictor, followed by Benefits. For Indians, the best predictor is Benefits, followed by Disgust and Religion. In both countries, frequency of **sushi**

Abstract

Sushi meal has been adapting to different countries and traditions ever since it was invented. Recently there is a growing popularity of ready-to-eat sushi meals, with new sushi production plants emerging in many countries. This relatively new sushi industry is facing many challenges, one of which is the microbiological hazard related to sushi consumption. The aim of this review was to summarize the most significant aspects with regard to microbiological quality of sushi, reported cases of sushi-related poisoning, as well as the potential of modern innovative and emerging technologies to inhibit microbiological growth. Although there is a limited amount of studies in relation to sushi shelf-life extension, the existing data shows potential of using novel minimal processing technologies to improve the shelf-life and quality of sushi meals. Those technologies include the use of cold plasma, plasma activated water and electrolyzed water, as well as the use of innovative packaging and edible coatings. Based on the collected data, the possible microbiological hazards in the production process of sushi, with possible use of emerging technologies to reduce or eliminate those risks, are also
