for their great love and support

## ACKNOWLEDGEMENTS

I would like to express my special appreciation and thanks to my advisor, Professor Dr. Jeremy May. He has been a tremendous mentor for me. His passion for chemistry is the real inspiration to me as well as to other members of our group. It is valuable of him as a supervisor that he has never put us under any pressure. Instead of pushing us to work hard, he has his own way to stimulate the endeavor inside each of us to go to the lab to set up reactions. An example is that we have been narrated with his great enthusiasm the interesting research from many other groups after each of his journey to conferences and meetings. When my research got stuck and it happened frequently, he was very patient and always came up with suggestions and solutions to help me overcome the problems. It is sure that under his guidance I have grown greatly as a research scientist. I would like to wish him a successful career and a happy life with his wonderful family.

A special thanks to my family. Words cannot express how grateful I am to my parents for all of the sacrifices that they have made on my behalf. Their eternal love and prayer for me were what empowered me so far. I would also like to thank my younger brother for all of the playful memories we had together during my childhood. He is always a little brother that I am also very proud of. The greatest support has come from my beloved wife whose devotion to me and our family is truly priceless. Without her by my side, I would have never sustained all the hard time and pressure I had to endure during my graduate study. I also thank her for having with me a wonderful boy who is the real source of joy and happiness for every single day. Our happiness will double soon as the second boy is on his way. We cannot wait to meet him.

Lastly, I would like to thank all of the group members I have worked with during the years, Brian, Santa, Miguel, DK, Ravi, Phong, Edward, Emma, Alan, Krit, Lily, and Truong. I appreciate all the jokes and laughs we had together that really helped us get through the burdensome graduate study more delightfully. I also thank them for all of the useful discussions and suggestions to help me tackle a lot of problems I had in my research. All of them will be remembered to the rest of my life.

#### Abstract

A BINOL-catalyzed conjugate addition was shown in our laboratory to be compatible with unprotected indole substrates. This was considered to be an advantage over typical organometallic strategies since it allowed the use of mild boron-based nucleophiles. With this well established method, we investigated the synthesis of a variety of chiral heterocyclic compounds. A new method was developed showing great compatibility with different heteroaryl structures. Along with that, a new BINOL catalyst was introduced that exhibited superior catalytic activity to previously used catalysts.

As proposed for previous studies, the rate determining step of the transformation was the carbon-carbon bond formation. In another project, we carried out a Hammet plot study to investigate the electronic effects of the aryl groups on the reaction rate. The results provided solid support for the proposal mentioned above.

Work in our laboratory showed that heteroaryltrifluoroborates exhibited superior reactivity to boronic acids in the synthesis of chiral bis-heterocycles. Therefore, in the latest project, we made use of aryltrifluoroborates in BINOL catalysis to construct different chiral bis-aryl compounds, whose structures were present in a number of important molecules. As a result, a new strategy was successfully established allowing access to a variety of enantioenriched diarylalkanes.

## Chapter One

## An introduction to the synthesis of chiral heterocyclic molecules via conjugate addition

### 1.1. Introduction

It is undoubted that heterocycles are an important class of organic compounds. They are present in a number of natural products that possess significant bioactivities. They also play important roles as useful synthetic moieties such as chiral auxiliaries ${ }^{1}$ and directing groups in regioselective transformations. ${ }^{2}$

These vital roles of heterocyclic compounds have stimulated synthetic chemists to devote their efforts in developing strategies for their synthesis as well as the functionalization of heterocycles. ${ }^{3}$ However, stereoselective transformations in the presence of heterocyclic structures, especially with the lack of protecting groups, have received less attention. It is presumably due to the propensity of coordinating atoms on the heterocycles to interact with activating species, therefore preventing the reactions from achieving the desired reactivity and selectivity. In the following sections, we will discuss on different methods for access to $\alpha$-chiral heterocyles with a focus on 1,4addition.

### 1.2. Flinderole $\mathbf{C}$ as the inspiration for chiral heterocycles

Flinderole C, a natural product isolated from Flindersia amboinensis, exhibits antimalarial activity against the chloroquine-resistant Plasmodium falciparum with a low $\mathrm{IC}_{50}$ of $0.34 \mu \mathrm{M}$. This interesting activity makes flinderole C a potential candidate for the treatment of chloroquine-resistant malaria and consequently a target of several synthetic
efforts with the hope of accessing a large quantity of the substance. However, there has been no report of an enantioselective synthesis of flinderole C so far. Being interested in addressing this problem, we joined the field and were able to come up with a synthetic route (Scheme 1.1.2) for an efficient selective preparation of flinderole C.

Scheme 1.1.2. Retrosynthesis of flinderole C.

As demonstrated in the retrosynthetic analysis, the most important disconnection requires the introduction of a vinyl group to an indole-appended enone in a highly stereoselective manner (4 to 5). The newly formed stereocenter $\alpha$ to the indole moiety will control the formation of the other centers so that the synthesis can be achieved without employing any more chiral reagents. A wide literature search was made to seek an appropriate strategy for that purpose, and to our surprise there are few examples of such transformation. Therefore, the development of an asymmetric conjugate addition that is compatible with indoles and a wider range of heterocycle structures is of great importance.

### 1.3. Metal mediated transformations

### 1.3.1. Chiral Lewis acid

The use of a lewis acid to facilitate the Friedel-Crafts conjugate addition of indole to an $\alpha, \beta$-unsaturated enone was first reported by Michael Kerr in $1996 .{ }^{4}$ In this work, 2.5 $\mathrm{mol} \%$ of $\mathrm{Yb}(\mathrm{OTf})_{3}$ was used to promote the addition of indole to different enones at room temperature (Scheme 1.3.1.1).

Scheme 1.3.1.1. Racemic Lewis acid catalyzed Friedel-Crafts alkylation of indoles

This pioneering work has triggered a movement in the field of developing an asymmetric version of the addition of indoles to electron deficient olefins. A well-known method is the incorporation of a chiral ligand, which is typically a nitrogen or phosphorus containing compound, with a Lewis acidic metal center. The most widely used are the chiral bisoxazoline (BOX) and bisphosphorus ligands. To apply this catalytic system for the reactions, the substrates have to possess functional groups which can coordinate to the catalyst in a bidentate fashion.

In 2003, Jorgensen et al. revealed the enantioselective addition of indoles to different $\beta, \gamma$-unsaturated $\alpha$-ketoesters with the use of $\mathrm{Cu}(\mathrm{OTf})_{2}$ in combination with $(S)-t-\mathrm{Bu}$-BOX (Scheme 1.3.1.2a). ${ }^{5}$ Later in the same year, they extended their strategy to different alkylidene malonates using the same catalyst combination to achieve addition reactions in high yields, although with significantly lower selectivity (Scheme 1.3.1.2b). ${ }^{6}$ This
problem was later tackled by Tang et al. the year after. They developed the Michael addition of alkylidene malonates with indoles in high enantioselectivity by taking advantage of the combination of $\mathrm{Cu}\left(\mathrm{ClO}_{4}\right)_{2}$ and a $\mathrm{C}_{3}$-trisoxazoline ligand (Scheme 1.3.1.2c). ${ }^{7}$

Scheme 1.3.1.2. Asymmetric addition of indoles to (a) unsaturated ketoesters and (b), (c) diesters

The major problem of the use of bidentate substrates is the difficulty in transforming these functional groups to other useful functionalities. In 2003, Umani-Ronchi et al. introduced the $\alpha, \beta$-unsaturated thioesters as a new class of substrates with a removable 2sulfanylbenzoxazole auxiliary for the asymmetric Michael addition reaction with
indoles. ${ }^{8}$ The subsequent treatments of the products with appropriate nucleophiles lead to the formation of different molecules of practical importance (Scheme 1.3.1.2).

Scheme 1.3.1.2. Asymmetric Friedel -Crafts reaction of indoles and unsaturated thioesters

Later, $\quad$ acylphosphonate, ${ }^{9} \quad \beta$-ketophosphonate, ${ }^{10} \quad \alpha^{\prime}$-hydroxyketone, ${ }^{11} \quad$ and acylimidazole ${ }^{12}$ substrates were also demonstrated to be effective counterparts for interaction with a chiral metallic center to yield excellent selectivity in the reaction with indoles and pyrroles (Scheme 1.3.1.4). These groups were later transformed to different functionalities, confirming the great utility of the strategy in organic synthesis.

Scheme 1.3.1.4. Enantioselective Friedel-Crafts reactions using (a) acyphosphonates;
(b) $\beta$-ketophosphophonates; (c) $\alpha^{\prime}$-hydroxyketones; (d) acylimidazole

Nitroalkenes were first examined as Michael acceptors for indoles by Umani-Rochi in 2005 using a [SalenAlCl] complex as the catalyst. However, the reactions proceeded in moderate yields and low enantiomeric excesses (Scheme 1.3.1.5a). ${ }^{13}$ Later in 2006, Zhou et al. ${ }^{14}$ and Du et al. ${ }^{15}$ independently developed similar zinc-based catalysts to enhance the reactivity and selectivity of the transformation (Scheme 1.3.1.5b-c). The nitro group
was proposed to provide a bidentate coordination to the metal giving an unusual fourmembered ring interaction.

Scheme 1.3.1.5. Asymmetric Friedel-Crafts reactions of indoles and nitroalkenes

In their attempts to make the simple enones viable for the Michael addition with indoles, the Umani-Rochi group employed one more time the chiral aluminum based catalyst [SalenAlCl], which could provide reactions with acceptable yields and moderate enatioselectivities (Scheme 1.3.1.6). ${ }^{16}$

Scheme 1.3.1.6. Enantioselective Michael addition of indoles to simple enones.

As shown so far, the Friedel-Crafts reactions of indole have been exploited for the asymmetric Michael addition to various types of substrates. Despite the considerable importance of these transformations in the establishment of a stereocenter adjacent to indole structures, the tendency of indoles to only give functionalization at the C 3 position has largely limited the scope of the methods. A potential alternative approach is employing an $\alpha, \beta$-unsaturated carbonyl functionalized with indolyl or heteroaryl groups at the desired contact point on the ring. This will eliminate the Friedel-Crafts regioselectivity controlled by the electronic nature of the heteroarenes. The work of Fillion and coworkers in 2009 took advantage of this tactic in synthesizing an array of all carbon quaternary centers neighboring a number of prefunctionalized heterocycles and aromatic structures. ${ }^{17}$ As illustrated in Scheme 1.3.1.7, Fillion was successful in introducing alkyl groups to different heterocyclic alkylidene Meldrum's acids by using a dialkylzinc reagent and a chiral copper catalyst. In light of the synthesis of flinderole C, we find this strategy promising for the 2-indole-appended enone that is required to access the key intermediate 4 , which cannot be achieved by reacting indole with an enone substrate.

Scheme 1.3.1.7. Asymmetric conjugate addition of diethylzinc to $\beta$-arylalkylidene Meldrum's acids

### 1.3.2. Transition metal catalyzed 1,4 -addition

Although the synthesis of chiral $\alpha$-branched heterocycles via organometallic processes have received comparable attention, ${ }^{18} 1,4$-addition reactions compatible with indoles catalyzed by transition metal have rarely been reported. The only example we were able to find was the work of Morken et al. in 2008. They utilized a nickel complex as the catalyst in the presence of a chiral phosphoramidite ligand to bring about the enantioselective conjugate addition of allylpinacolboranes to dialkylidene ketones. The reactions proceeded with good yields and great selectivities (Scheme 1.3.2). ${ }^{19}$

Scheme 1.3.2. Nickel catalyzed conjugate allylation of activated enones

### 1.4. Organocatalytic transformations

In 2001, MacMillan et. al. introduced the first asymmetric organocatalytic conjugate addition of pyrroles to enal substrates using a chiral secondary amine catalyst (Scheme 1.4.1). ${ }^{20}$ This work takes advantage of the ability of iminium catalysis to facilitate the 1,4 -addition to enals, which is known to be prone to 1,2 -addition under acidic conditions, due to the inherent steric hindrance of the catalyst.

Scheme 1.4.1. Asymmetric Friedel-Crafts alkylation of pyrroles using a chiral secondary amine catalyst

The following year, 2002, they extended it to indole substrates with as much success as they had achieved with pyrroles (Scheme 1.4.2). ${ }^{21}$

Scheme 1.4.2. Asymmetric Friedel-Crafts alkylation of indoles using a chiral secondary amine catalyst

This strategy was later applied to cyclic enals and proved to be efficient in synthesizing in gram scale compound $\mathbf{6 4}$ as a highly potent selective serotonin reuptake inhibitor (Scheme 1.4.3a). ${ }^{22}$ Later in 2007, an intramolecular version of the transformation was performed by Xiao et al. (Scheme 1.4.3b). ${ }^{23}$

b.

Scheme 1.4.3. Imidazolidinone catalysis in (a) addition of indoles to cyclic enals; (b) intramolecular addition of indoles to enals.

In 2007, the MacMillan group demonstrated the elegant use of nucleophilic 2-indolyl and 2-benzofuranyl trifluoroborate salts to overcome the restriction of Friedel-Crafts regioselectivity of plain nucleophiles (Scheme 1.4.4). ${ }^{24}$

Scheme 1.4.4. Asymmetric conjugate addition of aryltrifluoroborate salts to enals catalyzed by imidazolidinone catalyst

As also mentioned in section 1.3.1, a nitro group could coordinate in a bidentate fashion to a metallic center in the activation of nitroalkenes for the Michael addition of indole reagents. A similar chelating mode can be achieved by the use of a double hydrogen-bonding chiral thiourea ${ }^{25}$ or chiral diamine catalyst ${ }^{26}$ (Scheme 1.4.5). The reactions proceeded in good yields with moderate ee's in the former and low ee's in the latter. Subsequent attempts in designing more efficient thiourea catalysts were made Connon ${ }^{27}$ without significant improvement, although the work introduced a library of interesting novel thiourea structures.

Scheme 1.4.5. Asymmetric conjugate addition of indoles to nitroalkenes catalyzed by (a) a chiral thiourea catalyst; (b) a chiral diamine catalyst

Such low selectivity could be overcome by the utilization of more acidic catalyst. Seidel and coworkers designed a novel thioamide containing a protonated quinoline moiety which dramatically enhanced the selectivity (Scheme 1.4.6). ${ }^{28}$

Scheme 1.4.6. Asymmetric conjugate addition of indoles to nitroalkenes catalyzed by a cationic thiourea catalyst

Chiral phosphoric acids were introduced by Akiyama and coworkers as efficient catalysts for the Friedel-Crafts addition of indoles to nitroalkenes (Scheme 1.4.7). ${ }^{29}$ In this transformation, the phosphoric acid was proposed to activate the nitro group and interact with the indole nitrogen both through hydrogen bonding. This proposal was made by the observation of the deterioration of both yield and selectivity when N -methyl indole was in use.

Scheme 1.4.7. Asymmetric conjugate addition of indoles to nitroalkenes catalyzed by chiral phosphoric acid

The above mentioned type of interaction enabled the use of simple $\alpha, \beta$-unsaturated carbonyl compounds that can only provide monodentate coordination to an acid. In fact, two years before Akiyama's work was published, Xia et al. had discovered that commercial $D$-camphor sulfonic acid could trigger an enantioselective Michael addition of indoles to a variety of aromatic enones albeit in impractical selectivities (Scheme 1.4.8a). ${ }^{30}$ Two years later, in 2008, Zhou et al. utilized a chiral phosphoric acid to facilitate a similar transformation, however without a significant improvement (Scheme 1.4.8). ${ }^{31}$ It is worth mentioning that the viability of simple enones in the reaction with indoles was confirmed by Umani-Ronchi as described in previous section.

Scheme 1.4.8. Asymmetric conjugate addition of indoles to enones catalyzed by (a) $D$-camphor sulfonic acid; (b) chiral phosphoric acid

In 2008, Rueping et al. reported their pioneering work in using chiral $N$-triflyl phosphoramide to catalyze the 1,4 -addition of indoles to $\beta, \gamma$-unsaturated $\alpha$-keto esters (Scheme 1.4.9a). ${ }^{32}$ The reactions proceeded with high yields and selectivities. Later in the same year, this catalyst system was used with slight modification for the reaction of 4,7dihydroxyindoles by You et al. (Scheme 1.4.9b). ${ }^{33}$

Scheme 1.4.9. N-triflylphosphoramide catalyzed conjugate addition of (a) Indoles and (b) dihydroindoles to unsaturated esters

So far, we have depicted a comprehensive picture of the establishment of a stereocenter alpha to heterocylic structures through Michael addition reactions. In general, methods have been predominantly built around Friedel-Crafts reactions, which are not appropriate for the synthesis of flinderole C due to the restrictions in regioselectivity. A suitable solution is then to employ either heteroaryl enones (Fillion and Morken) or heteroarylboron reagents (MacMillan), which can suppress the FriedelCrafts selectivity rendered by the nucleophiles. Among these strategies, MacMillan's work seems to serve as the most suitable system for our study towards flinderole C synthesis. However, this method only works for enals since secondary amine catalysts exhibit poor reactivity towards enones in the formation of iminium species. We also find
that typical organometallic conjugate additions are rarely compatible with heterocycles, and strong nucleophiles such as Grignard reagents are definitely detrimental to unprotected nitrogen atoms on the ring. Therefore, we wish to seek for an organocatalyst system which can enable the employment of mild nucleophiles for compatibility with heterocyclic compounds. In the next section, we will discuss several potential candidates and the one of our choice.

### 1.5. Other organocatalytic methods using mild boronate nucleophiles

### 1.5.1. Bifunctional thioureas

Thioureas are known for a doubly hydrogen bonded interaction with electronegative atoms. In all examples described in the previous section, the substrates that contained dicarbonyl or nitro groups could coordinate in a bidentate mode. Consequently, that leads to a high energy four-membered or nine-membered ring binding interaction resulting in low selectivity for the reactions. In 2010, Takemoto et al. designed a novel iminophenol thiourea catalyst to catalyze the 1,4 -addition of vinylboronic acids to enones containing an $\gamma$-hydroxy group (Scheme 1.5.1). ${ }^{34}$ The proposed transition state invokes a sixmembered ring chelation through hydrogen bonds between the $\mathrm{N}-\mathrm{H}$ 's and the carbonyl oxygen as well as dual coordination of the substrate and the catalyst to the boronic acid to trigger the bond formation. Although the conversion and selectivity on the reactions are comparatively high, the requirement for a hydroxyl group from the substrates significantly limits the method.

Scheme 1.5.1. Enantioselective conjugate addition of vinylboronic acids to $\gamma$ -hydroxy-enones catalyzed by thiourea catalyst

### 1.5.2. Tartaric acid catalyzed conjugate addition

In 2010, Sugiura et al. employed a tartaric acid derivative for the asymmetric conjugate addition of vinylboronic acids to simple enones (Scheme 1.5.2). ${ }^{35}$ Although the transformation gave a good yield, the selectivity was moderate. Such selectivity, in our vision, is still far from practical especially in the stereoselective synthesis of a natural product that possesses bioactivity attributed to only one stereoisomer.

Scheme 1.5.2. Enantioselective conjugate addition of vinylboronic acids to aromatic enones catalyzed by tartaric acid catalyst

### 1.5.3. BINOL catalyzed conjugate addition

### 1.5.3.1. Chong's work

In 2000, Chong and coworkers reported the use of a BINOL derivative in the conjugate addition reaction of alkynylborate salts to aromatic enones for the first time (Scheme 1.5.3.1.1). ${ }^{36}$ Although the reactions advanced with high yields and great selectivities, the requirement for stoichiometric amounts of BINOL was a limitation of the transformation.

Scheme 1.5.3.1.1. Enantioselective conjugate addition of alkynylborate salts to enones facilitated by stoichiometric BINOL

In 2005, they were successful in developing a catalytic version of the strategy in which the loading of BINOL 95 could be dropped to $15 \mathrm{~mol} \%$ (Scheme 1.5.3.1.2a). ${ }^{37}$ In this work, the reaction of a furan-appended enone was carried out, showing a potential application to a wider range of heterocylic substrates. Two years later, in 2007, they disclosed the expansion to different vinylboronates with the same level of success (Scheme 1.5.3.1.2b). ${ }^{38}$
a.

Scheme 1.5.3.1.2. BINOL catalyzed conjugate addition of (a) alkynylboronic esters and (b) vinylboronic esters to enones

At this point, we found this method advantageous for our study since it allows the use of a mild boron nucleophile and simple enone susbtrates. In addition, it also enables the introduction of not only vinyl groups, but also alkynyl groups. The latter could not be added by typical organometallic processes. Furthermore, the great reactivity and selectivity of the reaction make it a trustable and interesting base for approaching the synthesis of flinderole C. The background of this chemistry will be discussed deeper in chapter 3 where we will present our experimental mechanistic study.

### 1.5.3.2. May's work

As mentioned in the previous section, we decided to test the viability of an unprotected indole substrate, especially 2-indole enone, in a BINOL-catalyzed conjugate addition. However, due to the scant availability of indoles prefunctionalized at the 2-
position, we made our first investigation on 3-indole-appended enones as model substrates for our study. This work was performed by a former member of our group, Dr. Brian Lundy. ${ }^{39}$ Although the conditions reported by the Chong group operated smoothly with chalcone substrates, they were ineffective with indole substrates. An extensive examination of reaction conditions led to a great deviation from the original. Specifically, boronic acids were used in place of boronic esters owing to the readiness and ease of handling of the acids. Furthermore, a highly fluorinated BINOL structure was employed to obtain sufficient reactivity and selectivity for the reactions. Finally, a catalytic amount of $\mathrm{Mg}(\mathrm{Ot}-\mathrm{Bu})_{2}$ as an additive was shown to be vital. With those newly established conditions, Lundy was able to build a library of chiral 4-(3-indolyl)-butan-2-ones possessing $\beta$-vinyl or alkynyl groups (Scheme 1.5.3.2). The conditions were later applied to the 2-indole enone without great success. Efforts to elevate the efficiency of the reaction to the same degree as with 3-indole enones were not successful, with $55 \%$ as the best yield at higher temperature in toluene and with $\mathrm{Cs}_{2} \mathrm{CO}_{3}$ as the additive.

Scheme 1.5.3.2. BINOL-catalyzed conjugate addition of vinylboronic acids to indoleappended enones

Despite the unexpected low reactivity towards the target 2 -indole substrates, the method provided a potentially powerful tool for the construction of different other chiral heterocycles. The following chapter will discuss the main body of our research on the expansion of the scope of the chemistry to a variety of heterocyclic structures that may have great importance in medicinal chemistry.

## Chapter Two

## BINOL-catalyzed asymmetric synthesis of chiral heterocycles ${ }^{1}$

### 2.1. Introduction

As mentioned in Chapter 1, our laboratory was successful in developing a highly enantioselective conjugate addition of mild vinylboronic acids to indole-appended enones using BINOL as the catalyst. In this chapter, we will report our work on the application of the strategy to access different chiral heterocyclic compounds.

### 2.2. Reaction optimization

### 2.2.1. Initial screening: multi-parameter

Starting out with the conditions developed in our previous work, we used a 2 thiophenyl enone as a substrate for reaction optimization (entry 1, Table 2.2.1). However, only an $11 \%$ yield of product was obtained. Switching to refluxing toluene gave a better yield (entry 2). Increasing the equivalents of boronic acid significantly improved the conversion (entry 3 and 4). Finally, by increasing the catalyst loading to $20 \mathrm{~mol} \%$, we were able to obtain the product in $96 \%$ yield and 95:5 ee.

Table 2.2.1. Optimization table

### 2.2.2. Catalyst screening

Although catalyst $\mathbf{1 0 0}$ appeared to work well under the optimized conditions, a better catalyst may shorten the reaction time as well as give higher enantioselectivities while still maintaining good reaction yields. A variety of BINOL catalysts that have different electron-withdrawing substituents at the $3,3^{\prime}$ positions were then synthesized, and a direct comparison of these catalysts was made with the thiophene substrate $\mathbf{1 0 2}$ (Table 2.2.2). Without the presence of the BINOL catalyst, a small amount of product 5 was observed from a background reaction (entry 1). BINOL (104) slightly improved the reaction rate and exhibited a certain degree of stereoinduction (entry 2). Better yields and enantioselectivities were obtained using 105, 106, and 100 (entries 3,4 and 5). The most effective catalyst, however, was 107, which gave $87 \%$ yield and $92 \%$ ee in even shorter time (entry 6). These results showed a correlation between the degree of fluorination and the reaction outcome. Nevertheless, catalyst 108, which has the highest incorporation of fluorine, only gave 53\% yield (entry 7).

Table 2.2.2. Reactivity of different BINOL

### 2.3. Reaction scope

The reactions of a variety of heterocycle-appended enones were then investigated by employing the first generation catalyst 100 and the novel BINOL 107. Thiophene and furan enones worked well under the reaction conditions (Table 2.3.1). In some cases, catalyst 107 gave comparable yields and ee's in much shorter time compared to catalyst 100 (entries 1,2 and 9,10). Vinyl and alkynyl substituents were introduced by using various vinylboronic acids and an alkynylboronic ester (entry 6), respectively. As expected, no 1,6 - or 1,2 - addition product was observed when using a 3 -furan dienone substrate (entries 7,8).

Table 2.3.1. Furan and thiophene substrates

Lower enantiomeric excesses were observed for thiazole and benzothiazole products (Table 2.3.2). Presumably, this result can be accounted for by the epimerization of the products under the reaction conditions. A control experiment was conducted in which the thiazole product 119 was resubjected to the reaction conditions. The recovered product had a diminished enantiomeric excess. Therefore, a faster reaction time could help improve the optical purity of the products. In fact, catalyst $\mathbf{1 0 7}$, to some extent, proved to
be efficient for such purpose. In most cases (entries 4-13), better yields and ee's were achieved when using $\mathbf{1 0 7}$ relative to $\mathbf{1 0 0}$ due to much shorter reaction times.

Table 2.3.2. Thiazole and benzothiazoles substrates

${ }^{a} \mathrm{PhCl}$ as solvent, reflux

High conversion was still observed in pyridine, quinoline, and pyrazine products (Table 2.3.3). Epimerization appeared to occur in 2- and 4-pyridyl products (entries 1 and
5). However, this did not occur with the 3-pyridyl adduct. These results reflect that the benzylic protons in 2- and 4-pyridyl products are more acidic than that in the 3-pyridyl product. The same trend was also present in the quinoline product (entry 7) but not in the pyrazine adduct (entry 9). Catalyst 107 again showed its value in improving the reaction outcome. Better optical purities and comparable yields of products were gained when using 107 (entries 2,3,6,8 and 10).

Table 2.3.3. Pyridine, Quinoline and Pyrazine substrates

|  | $\begin{array}{r} 20 \\ 10 \mathrm{~m} \end{array}$ | ic acid <br> \% catalyst <br> $\mathrm{Mg}(\mathrm{Ot}$-Bu) <br> , reflux |  | $\begin{gathered} \text { R } \\ = \end{gathered}$ |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
| Entry | Product | catalyst | time | yield | er |
| 1 |  | 100 | 3h | 71\% | 86:14 |
| 2 |  | $107{ }^{\text {a }}$ | 16h | 95\% | 94:6 |
| 3 | , | 107 | 75 min | 92\% | 93:7 |
| 4 |  | 100 | 15h | 87\% | 98:2 |
| 5 |  | 100 | 21h | 92\% | 91:9 |
| 6 |  | 107 | 22h | 91\% | 95:5 |
| 7 |  | 100 | 1 h | 85\% | 88:12 |
| 8 | , | $107{ }^{\text {a }}$ | 5h | 94\% | 96:4 |
| 9 |  | 100 | 4h | 95\% | 92:8 |
| 10 |  | $107{ }^{\text {a }}$ | 8h | 99\% | 95:5 |

Unprotected pyrrole and imidazolyl enones were also tolerated under the reaction conditions (Table 2.3.4). In the case of pyrrole, the reaction of unprotected substrates (entries 1 and 2) afforded the product in only moderate yields due to the formation of a side product. This side product was not able to be characterized because of the difficulty in isolating it from the mixture with catalyst, which had a similar $\mathrm{R}_{\mathrm{F}}$. The by-product formation increased as the reaction temperature was elevated. Performing the reaction at $70^{\circ} \mathrm{C}$ can both give a moderate yield of product and minimize the formation of the byproduct. The $N$-methylpyrrole substrate, on the other hand, worked well without side product formation (entries 3 and 4). Unlike pyrrole, unprotected imidazole substrates afforded products in high yields (entries 5,6,7 and 8), though the $N$-methyl enone (entry 9) gave an even better yield. Again, in most cases, catalyst 107 afforded higher conversion, much faster reaction time, and even greater enantioselectivity (entries 2, 6, and 9).

## Table 2.3.4. Pyrrole and imidazole substrates

Finally, a very electron rich substrate was tried (Scheme 2.3.1). This enone is predicted to have low reactivity toward nucleophilic attack due to its low electrophilicity and steric hindrance. However, it turned out to be the most reactive substrate under these organocatalytic conditions. Both catalyst 100 and 107 gave excellent yields and enantiomeric excesses in only 4 hours and 1 hour, respectively. This same substrate afforded the product in only $63 \%$ yield under cuprate conjugate addition conditions. This cuprate addition was also performed with unprotected pyrrole and imidazole substrates, and no product was obtained.

Scheme 2.3.1. Reactivity of electron rich substrate

### 2.4. Conclusion

The enantioselective conjugate addition of vinylboronic acids and alkynyl boronic esters to $\beta$ - heteroaryl $\alpha, \beta$-unsaturated carbonyl compounds has been investigated. The method allows for the formation of stereocenters adjacent to a variety of common heterocycles in moderate to good yields and high selectivity. A novel BINOL catalyst (107) was created to enhance the reaction rate as well as selectivity. Electron-rich substrates were shown to be very reactive under these reaction conditions. Further investigation in the reaction mechanism as well as development of more efficient catalysts is underway to achieve higher conversion and greater selectivity.

### 2.5. Experimental section

### 2.5.1. General consideration

All reactions were carried out in flame- or oven-dried glassware. THF, toluene and $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ were purged with argon and dried over activated alumina columns. Flash chromatography was performed on $60 \AA$ silica gel (EMD Chemicals Inc). Preparative plate chromatography was performed on EMD silica gel plates, $60 \AA$, with UV-254
indicator. Chemical names were generated using Cambridge soft ChemBioDraw Ultra 12.0. Analysis by HPLC was performed on a Shimadzu Prominence LC (LC-20AB) equipped with a SPD-20A UV-Vis detector and a Chiralpak or Chiralcel ( $250 \mathrm{~mm} \times 4.6$ mm ) column (see below for column details). Analytical thin layer chromatography was performed on EMD silica gel/TLC plates with fluorescent detector 254 nm . The ${ }^{1} \mathrm{H},{ }^{13} \mathrm{C}$ and ${ }^{19}$ F NMR spectra were recorded on a JEOL ECA- 500 or ECX-400P spectrometer using residual solvent peak as an internal standard $\left(\mathrm{CDCl}_{3}: 7.25 \mathrm{ppm}\right.$ for ${ }^{1} \mathrm{H} \mathrm{NMR}$ and 77.16 ppm for ${ }^{13} \mathrm{C}$ NMR). Hexafluorobenzene ( $\delta=-164.9 \mathrm{ppm}$ ) was employed as an external standard in 19F NMR spectra. NMR yields were determined by addition of 0.5 equivalent of methyl (4-nitrophenyl) carboxylate as an internal standard to the crude reaction mixture. IR spectra were obtained using a ThermoNicolet Avatar 370 FT-IR instrument. HRMS analyses were performed under contract by UT Austin's mass spectrometric facility via ESI method and a US10252005 instrument.

### 2.5.2. HPLC columns for separation of enantiomers

Chiralpak AY-3: Amylose tris-(5-chloro-2-methylphenylcarbamate) coated on $3 \mu \mathrm{~m}$ silica gel.

Chiralpak AD-H: Amylose tris-(3,5-dimethylphenylcarbamate) coated on $5 \mu \mathrm{~m}$ silica gel.

Chiralpak ID: Amylose tris-(3-chlorophenylcarbamate) immobilized on $5 \mu \mathrm{~m}$ silica gel.

Chiralcel OJ-H: Cellulose tris-(4-methylbenzoate) coated on $5 \mu \mathrm{~m}$ silica gel.
Chiralcel OD-H: Cellulose tris-(3,5-dimethylphenylcarbamate) coated on $5 \mu \mathrm{~m}$ silica gel.

Chiralpak AS-H: Amylose tris-[(S)- $\alpha$-methylbenzylcarbamate) coated on $5 \mu \mathrm{~m}$ silica gel.

### 2.5.3. Materials

Commercially available compounds were purchased from Aldrich, Acros, and Alfa Aesar and were used without further purification.

### 2.5.4. General procedures for starting material synthesis

To a flask equipped with a stir bar and a condenser was added carboxaldehyde (4 mmol, 1.0 equiv), 1-(triphenylphosphoranylidene)-2-propanone ( $5 \mathrm{mmol}, 1.25$ equiv), and toluene $(8 \mathrm{~mL})$. The reaction mixture was refluxed overnight. After completion, the reaction mixture was concentrated via rotary evaporation. The crude mixture was purified via flash column chromatography with an appropriate eluent on silica gel.
2.5.4.1. Synthesis of $(E)$-4-(furan-2-yl)-6-phenylhex-5-en-2-one, precursor to 111, 112, 113

See the general procedure for enone formation above. The crude reaction mixture was purified via flash column chromatography with a $10-20 \%$ gradient of ethyl acetate in hexanes as eluent on silica gel to afford a white solid ( $539.2 \mathrm{mg}, 3.96 \mathrm{mmol}, 99 \%$ yield). ${ }^{1} \mathrm{H}$ NMR ( $400 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ): $\delta 7.66(\mathrm{~s}, 1 \mathrm{H}), 7.41(\mathrm{~s}, 1 \mathrm{H}), 7.39(\mathrm{~d}, \mathrm{~J}=16.5 \mathrm{~Hz}, 1 \mathrm{H}), 6.57$ $(\mathrm{d}, \mathrm{J}=1.8 \mathrm{~Hz}, 1 \mathrm{H}), 6.41(\mathrm{~d}, \mathrm{~J}=16.0 \mathrm{~Hz}, 1 \mathrm{H}), 2.30(\mathrm{~s}, 3 \mathrm{H}) .{ }^{13} \mathrm{C}$ NMR (125.77 MHz, $\left.\mathrm{CDCl}_{3}\right): \delta 198.3,145.0,144.6,133.5,127.3,122.8,107.5,27.4$ LR-MS-EI m/z: $\left[\mathrm{M}^{+}\right]$,
calculated for $\mathrm{C}_{8} \mathrm{H}_{8} \mathrm{O}_{2}$ 136.1479, found 136. IR (neat): 3115, 2924, 2861, 1666, 1629, $1268,1158,974,869 \mathrm{~cm}^{-1}$.

### 2.5.4.2. Synthesis of (3E,5E)-6-(furan-3-yl)hexa-3,5-dien-2-one, precursor to 114

To a flask equipped with a stir bar and a condenser was added furan-3-carbaldehyde ( $4 \mathrm{mmol}, 1.0$ equiv), (triphenylphosphoranylidene)acetaldehyde ( $5 \mathrm{mmol}, 1.25$ equiv), and toluene ( 8 mL ). The reaction mixture was refluxed overnight. After completion, 1-(triphenylphosphoranylidene)-2-propanone ( $5 \mathrm{mmol}, 1.25$ equiv) was added to reaction mixture which was refluxed for another 12 hours. The reaction mixture was then concentrated via rotary evaporation. The crude mixture was purified via flash column chromatography with $5-10 \%$ ethyl acetate in hexane on silica gel to obtain a yellowish solid ( $486.6 \mathrm{mg}, 3 \mathrm{mmol}, 75 \%$ yield). ${ }^{1} \mathrm{H}$ NMR ( $400 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ): $\delta 7.56(\mathrm{~s}, 1 \mathrm{H}), 7.41$ (s, 1H), 7.23 (dd, J= 16.0, 11.4 Hz, 1H), $6.83(\mathrm{~d}, \mathrm{~J}=15.6 \mathrm{~Hz}, 1 \mathrm{H}), 6.89(\mathrm{~m}, 2 \mathrm{H}), 6.19(\mathrm{~d}$, $\mathrm{J}=15.6 \mathrm{~Hz}, 1 \mathrm{H}), 2.29(\mathrm{~s}, 3 \mathrm{H}) .{ }^{13} \mathrm{C}$ NMR ( $100 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ): $\delta 198.6,144.3,143.5,142.9$, 131.1, 129.7, 126.6, 124.1, 107.4, 27.5. HR-MS-ESI m/z: [M+Na], calculated for $\mathrm{C}_{10} \mathrm{H}_{10} \mathrm{NaO}_{2}$ 185.0573, found 185.0570 IR (neat): 3122, 1625, 1254, 1163, 1086, 990, $868,788,638 \mathrm{~cm}^{-1}$.
2.5.4.3. Synthesis of $(E)-4$-(thiophen-2-yl)-but-3-en-2-one (102), precursor to 115 , 116, 117, 118

See the general procedure for enone formation above. 897.2 mg of 2 thiophenecarboxaldehyde was used. The crude reaction mixture was purified via flash column chromatography with a $5-10 \%$ gradient of ethyl acetate in hexanes as eluent on silica gel to afford a yellow oil ( $1.205 \mathrm{~g}, 7.92 \mathrm{mmol}, 99 \%$ yield). ${ }^{1} \mathrm{H}$ NMR ( 500 MHz , $\left.\mathrm{CDCl}_{3}\right): \delta 7.6(\mathrm{~d}, \mathrm{~J}=15.7 \mathrm{~Hz}, 1 \mathrm{H}), 7.37(\mathrm{~d}, \mathrm{~J}=4.5 \mathrm{~Hz}, 1 \mathrm{H}), 7.2(\mathrm{~d}, \mathrm{~J}=3.4 \mathrm{~Hz}, 1 \mathrm{H}), 7.03(\mathrm{dd}$, $\mathrm{J}=4.5,3.4 \mathrm{~Hz}, 1 \mathrm{H}), 6.49(\mathrm{~d}, \mathrm{~J}=15.7 \mathrm{~Hz}, 1 \mathrm{H}), 2.30(\mathrm{~s}, 3 \mathrm{H}) .{ }^{13} \mathrm{C}$ NMR (125.77 MHz, $\mathrm{CDCl}_{3}$ ): $\delta 197.8,139.8,135.8,131.6,129.0,128.3,125.8,27.8 . \operatorname{IR}$ (neat): 1663,1613 , 1594, 1254, $966,710 \mathrm{~cm}^{-1}$.

### 2.5.4.4. Synthesis of ( $E$ )-4-(thiazol-2-yl)-but-3-en-2-one, precursor to 119,120

The compound was prepared following the procedure previously reported. ${ }^{2}$ To a solution of 2-bromothiazole ( $545 \mathrm{mg}, 3.3 \mathrm{mmol}$ ) in diethyl ether ( 4 ml ) at $-78^{\circ} \mathrm{C}$ was added dropwise 1.6 ml of n -butyl lithium ( 2.5 M solution in hexanes). The reaction mixture was stirred at $-78^{\circ} \mathrm{C}$ for 45 minutes. Dimethylformamide was then added and the reaction mixture was allowed to stir in 30 minutes at $-78^{\circ} \mathrm{C}$. Saturated NaCl and pentane were added and aqueous layer was brought to pH 8 by adding 2 M HCl . Product was extracted by ether. Combined organic layers was concentrated via rotary evaporation and purified via column chromatography using $10 \%$ diethyl ether in pentane as eluent. Thiazole-2carboxaldehyde was obtained as a yellow liquid. The Wittig reaction was carried out on the aldehyde following the above general procedure with a $10-20 \%$ gradient of ethyl acetate in hexanes as eluent on silica gel yielding a light brown solid ( $187.5 \mathrm{mg}, 1.22$ mmol, $37 \%$ overall yield). ${ }^{1} \mathrm{H}$ NMR ( $400 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ): $\delta 7.91(\mathrm{~d}, \mathrm{~J}=3.2 \mathrm{~Hz}, 1 \mathrm{H}), 7.61$
(d, J=16.4 Hz, 1H), $7.44(\mathrm{~d}, \mathrm{~J}=3.2 \mathrm{~Hz}, 1 \mathrm{H}), 6.91(\mathrm{~d}, \mathrm{~J}=16.49 \mathrm{~Hz}, 1 \mathrm{H}), 2.38(\mathrm{~s}, 3 \mathrm{H}) .{ }^{13} \mathrm{C}$ NMR (100.52 MHz, $\mathrm{CDCl}_{3}$ ): $\delta$ 197.7, 164.0, 144.9, 134.5, 130.8, 121.7, 27.9 IR (neat): $1663,1256,1224,969,752 \mathrm{~cm}^{-1}$.

### 2.5.4.5. Synthesis of $(E)$-4-(benzo[d]thiazol-2-yl)-but-3-en-2-one, precursor to 121, 122, 123, 124

See the general procedure for enone formation above. 726 mg of 2 benzothiazolecarboxaldehyde was used. The crude reaction mixture was purified via flash column chromatography with a $10-20 \%$ gradient of ethyl acetate in hexanes as eluent on silica gel to afford a light brown solid ( $852.1 \mathrm{mg}, 4.19 \mathrm{mmol}, 94 \%$ yield). ${ }^{1} \mathrm{H}$ NMR (400 MHz, $\mathrm{CDCl}_{3}$ ): $\delta 8.06$ (d, J= $8.2 \mathrm{~Hz}, 1 \mathrm{H}$ ), 7.89 (d, J= $7.79 \mathrm{~Hz}, 1 \mathrm{H}$ ), 7.70 (dd, $\mathrm{J}=16.0,1.1 \mathrm{~Hz}, 1 \mathrm{H}), 7.52(\mathrm{~m}, 1 \mathrm{H}), 7.45(\mathrm{~m}, 1 \mathrm{H}), 6.98(\mathrm{dd}, \mathrm{J}=16.0,1.1 \mathrm{~Hz}), 2.43(\mathrm{~s}, 3 \mathrm{H})$. ${ }^{13} \mathrm{C}$ NMR (100.52 MHz, $\mathrm{CDCl}_{3}$ ): $\delta 197.5,164,153.9,135.4,135.3,133.6,126.9,126.7$, 124.0, 121.9, 27.8. IR (neat): $1666,1254,958,762,731 \mathrm{~cm}^{-1}$.

### 2.5.4.6. Synthesis of (E)-4-(pyridin-2-yl)but-3-en-2-one, precursor to 125

See the general procedure for enone formation above. The crude reaction mixture was purified via flash column chromatography with a $20-40 \%$ gradient of ethyl acetate in hexanes as eluent on silica gel to afford light yellow oil (582.8 mg, $3.96 \mathrm{mmol}, 99 \%$ yield). The spectroscopic data for the compound was identical to that reported in the chemical literature. ${ }^{3}$

### 2.5.4.7. Synthesis of $(\boldsymbol{E})$-4-(pyridin-3-yl)but-3-en-2-one, precursor to 126

See the general procedure for enone formation above. The crude reaction mixture was purified via flash column chromatography with a $10-20 \%$ gradient of ethyl acetate in dichloromethane as eluent on silica gel to afford light yellow oil ( $541.6 \mathrm{mg}, 3.68 \mathrm{mmol}$, $92 \%$ yield). The spectroscopic data for the compound was identical to that reported in the chemical literature. ${ }^{3}$

### 2.5.4.8. Synthesis of (E)-4-(pyridin-4-yl)but-3-en-2-one, precursor to 127

See the general procedure for enone formation above. The crude reaction mixture was purified via flash column chromatography with a $10-20 \%$ gradient of ethyl acetate in chloroform as eluent on silica gel to afford a red brown solid ( $559.2 \mathrm{mg}, 3.8 \mathrm{mmol}, 95 \%$ yield). The spectroscopic data for the compounds was identical to that reported in the chemical literature. ${ }^{3}$

### 2.5.4.9. Synthesis of $(E)$-4-(quinolin-2-yl)but-3-en-2-one, precursor to 128

See the general procedure for enone formation above. The crude reaction mixture was purified via flash column chromatography with a $10-20 \%$ gradient of ethyl acetate in hexanes as eluent on silica gel to afford a brown solid ( $631.2 \mathrm{mg}, 3.2 \mathrm{mmol}, 80 \%$ yield). ${ }^{1} \mathrm{H} \operatorname{NMR}\left(500 \mathrm{MHz}, \mathrm{CDCl}_{3}\right): \delta 8.20(\mathrm{~d}, \mathrm{~J}=8.6 \mathrm{~Hz}, 1 \mathrm{H}), 8.11(\mathrm{~d}, \mathrm{~J}=8.6 \mathrm{~Hz}, 1 \mathrm{H}), 7.83(\mathrm{~d}$,
$\mathrm{J}=8.0 \mathrm{~Hz}, 1 \mathrm{H}), 7.75(\mathrm{~m}, 2 \mathrm{H}), 7.68(\mathrm{~d}, \mathrm{~J}=8.6 \mathrm{~Hz}, 1 \mathrm{H}), 7.59(\mathrm{t}, \mathrm{J}=6.9 \mathrm{~Hz}, 1 \mathrm{H}), 7.15(\mathrm{~d}, \mathrm{~J}=$ $16.6 \mathrm{~Hz}, 1 \mathrm{H}), 2.43(\mathrm{~s}, 3 \mathrm{H}) .{ }^{13} \mathrm{C}$ NMR (125.77 MHz, $\left.\mathrm{CDCl}_{3}\right): \delta 198.9,148.2,143.1,137.0$, 132.0, 130.3, 129.8, 128.2, 127.7, 127.6, 120.1, 27.7. LR-MS-EI m/z: [M+], calculated for $\mathrm{C}_{13} \mathrm{H}_{11} \mathrm{NO}_{2} 197.2325$, found 197. IR (neat): 1658, 1362, 1348, 1271, 1252, 985, 819, $760,656 \mathrm{~cm}^{-1}$.

### 2.5.4.10. Synthesis of $(\boldsymbol{E})$-4-(pyrazin-2-yl)but-3-en-2-one, precursor to 129

To a flame-dried 100 ml round bottom flask was added methyl pyrazine-2carboxylate $(1.38 \mathrm{~g}, 10 \mathrm{mmol})$ and 20 ml THF. The mixture was then cooled to $-78{ }^{\circ} \mathrm{C}$ followed by adding lithium aluminium hydride ( $189.8 \mathrm{mg}, 5 \mathrm{mmol}$ ) in THF ( 5 ml ). The reaction was stirred for another 20 minutes and quenched with acetic acid glacial ( 2 ml ) at $-78{ }^{\circ} \mathrm{C}$. When the reaction was warmed up to room temperature, $\mathrm{HCl} 3 \mathrm{~N}(3 \mathrm{ml})$ was added and organic layer was separated. The aqueous layer was then extracted with dichloromethane ( 3 times). The organic layers was combined and concentrated via rotary evaporation. The resulting mixture was purified via flash column chromatography with a $20-30 \%$ gradient of ethyl acetate in hexanes as eluent on silica gel to afford crude light yellow oil ( $235.0 \mathrm{mg}, 22 \%$ yield). The carboxaldehyde was confirmed by 2,4dinitrophenylhydrazine stain and was carried into the next reaction. The Wittig reaction was carried out following the general enone formation procedure above and was purified via flash column chromatography with a $10-40 \%$ gradient of ethyl acetate in hexanes as eluent on silica gel to afford a light yellow solid $(222.2 \mathrm{mg}, 1.5 \mathrm{mmol}, 15 \%$ overall yield after 2 steps). ${ }^{1} \mathrm{H}$ NMR ( $500 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 8.70(\mathrm{~s}, 1 \mathrm{H}), 8.60(\mathrm{~s}, 1 \mathrm{H}), 8.54(\mathrm{~s}, 1 \mathrm{H}), 7.52$
(d, J=16.0 Hz, 1H), $7.25(\mathrm{~d}, \mathrm{~J}=16.0 \mathrm{~Hz}, 1 \mathrm{H}), 2.41(\mathrm{~s}, 3 \mathrm{H}) .{ }^{13} \mathrm{C}$ NMR (125.77 MHz, $\left.\mathrm{CDCl}_{3}\right) \delta 197.9,148.9,145.4,145.3,145.0$ 137.8, 132.0 28.5 LR-MS-EI m/z: [M+], calculated for $\mathrm{C}_{8} \mathrm{H}_{8} \mathrm{~N}_{2} \mathrm{O}$ 148.1619, found 148. IR (neat): 1670, 1475, 1262, 1015, 984, $883,640 \mathrm{~cm}^{-1}$.

### 2.5.4.11. Synthesis of (E)-4-(1H-pyrrol-2-yl)-but-3-en-2-one, precursor to 130

See the general procedure for enone formation above. 1g of 2-pyrrolecarboxaldehyde was used. The crude reaction mixture was purified via flash column chromatography with a $10-40 \%$ gradient of ethyl acetate in hexanes as eluent on silica gel to afford a light yellow solid ( $1.3092 \mathrm{~g}, 7.69 \mathrm{mmol}, 73 \%$ yield). ${ }^{1} \mathrm{H}$ NMR ( $400 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ): $\delta 9.27(\mathrm{bs}$, $1 \mathrm{H}), 7.42(\mathrm{~d}, \mathrm{~J}=16.0 \mathrm{~Hz}, 1 \mathrm{H}), 7.00(\mathrm{~m}, 1 \mathrm{H}), 6.60(\mathrm{~m}, 1 \mathrm{H}), 6.39(\mathrm{~d}, \mathrm{~J}=16.0 \mathrm{~Hz}, 1 \mathrm{H}), 6.30$ ( $\mathrm{m}, 1 \mathrm{H}$ ), $2.33(\mathrm{~s}, 3 \mathrm{H}) .{ }^{13} \mathrm{C}$ NMR (100 MHz, CDCl3) $\delta$ 198.7, 133.8, 128.4, 123.6, 120.8, $115.8,111.3,26.9$ IR (neat): $3300,1629,1617,1265,1008,961,737 \mathrm{~cm}^{-1}$.

### 2.5.4.12. Synthesis of (E)-4-(1H-pyrrol-2-yl)-but-3-en-2-one, precursor to 131

To a flame-dried 25 ml round bottom flask was added (E)-4-(1H-pyrrol-2-yl)-but-3-en-2-one ( $500 \mathrm{mg}, 3.7 \mathrm{mmol}$ ), $\mathrm{NaH}(177.6 \mathrm{mg}, 4.4 \mathrm{mmol})$ and 7 ml anhydrous DMF. The mixture was then cooled to $0^{\circ} \mathrm{C}$ and stirred in 20 minutes. After 20 minutes, methyl iodide was added and the reaction was allowed to warm up to room temperature. After completion, reaction was quenched with water and extracted with dichloromethane (3 times). Organic layers were combined and washed with water and brine and dried over
magnesium sulfate. The crude mixture was concentrated via rotary evaporation and purified via flash column chromatography using $10-20 \%$ gradient of ethyl acetate in hexanes as eluent. The product was obtained as a yellow liquid (353mg, $2.37 \mathrm{mmol}, 64 \%$ yield). ${ }^{1} \mathrm{H}$ NMR ( $400 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ): $\delta 7.45(\mathrm{~d}, \mathrm{~J}=15.57 \mathrm{~Hz}, 1 \mathrm{H}), 6.78(\mathrm{~m}, 1 \mathrm{H}), 6.70(\mathrm{~m}$, $1 \mathrm{H}), 6.49(\mathrm{~d}, \mathrm{~J}=15.57 \mathrm{~Hz}, 1 \mathrm{H}), 6.18(\mathrm{~m}, 1 \mathrm{H}), 3.71(\mathrm{~s}, 3 \mathrm{H}), 2.3(\mathrm{~s}, 3 \mathrm{H}) .{ }^{13} \mathrm{C}$ NMR (100.52 $\mathrm{MHz}, \mathrm{CDCl}_{3}$ ): $\delta 197.8,130.7,129.3,127.8,121.6,112.6,109.7,34.5,28.3 . \operatorname{IR}$ (neat): $1613,1589,1480,1415,1271,1251,1059,967,730 \mathrm{~cm}^{-1}$.

### 2.5.4.13. Synthesis of (E)-4-(1H-imidazol-5-yl)but-3-en-2-one, precursor to 132

See the general procedure for enone formation above. The crude reaction mixture was purified via flash column chromatography with a $2-5 \%$ gradient of methanol in dichloromethane as eluent on silica gel to afford a yellowish solid $(381.2 \mathrm{mg}, 2.8 \mathrm{mmol}$, $70 \%$ yield). ${ }^{1} \mathrm{H}$ NMR ( $500 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ): $\delta 7.72(\mathrm{~s}, 1 \mathrm{H}), 7.47(\mathrm{~d}, \mathrm{~J}=16.0 \mathrm{~Hz}, 1 \mathrm{H}), 7.33$ (s, 1H), 2.33 (s, 3H). ${ }^{13} \mathrm{C}$ NMR (125.77 MHz, $\mathrm{CDCl}_{3}$ ): $\delta$ 199.0, 137.4, 134.6 (broad peak), 124.8, 119.1 (broad peak), 27.8. LR-MS-EI m/z: [M+], calculated for $\mathrm{C}_{7} \mathrm{H}_{8} \mathrm{~N}_{2} \mathrm{O}$ 136.1512, found 136. IR (neat): $3140,1609,1362,1270,1159,1099,977,621 \mathrm{~cm}^{-1}$

### 2.5.4.14. Synthesis of ( $E$ )-4-(1H-imidazol-2-yl)but-3-en-2-one, precursor to 133

(E)-4-(1H-imidazol-2-yl)but-3-en-2-one was synthesized following the literature procedure. ${ }^{4}$

### 2.5.4.15. Synthesis of (E)-4-(1-methyl-1H-imidazol-5-yl)but-3-en-2-one, precursor to

 134

See the general procedure for enone formation above. The crude reaction mixture was purified via flash column chromatography with a $40-100 \%$ gradient of ethyl acetate in hexanes as eluent on silica gel to get a yellowish solid ( $533.7 \mathrm{mg}, 3.98 \mathrm{mmol}, 98 \%$ yield). ${ }^{1} \mathrm{H} \operatorname{NMR}\left(500 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 7.37(\mathrm{~d}, \mathrm{~J}=15.5 \mathrm{~Hz}, 1 \mathrm{H}), 7.16(\mathrm{~s}, 1 \mathrm{H}), 7.15(\mathrm{~d}, \mathrm{~J}=15.5 \mathrm{~Hz}$, $1 \mathrm{H}), 6.99(\mathrm{~s}, 1 \mathrm{H}), 3.75(\mathrm{~s}, 3 \mathrm{H}), 2.34(\mathrm{~s}, 3 \mathrm{H}) .{ }^{13} \mathrm{C}$ NMR (125.77 MHz, $\left.\mathrm{CDCl}_{3}\right): \delta$ 197.7, 143.3, 130.6, 127.5, 126.1, 124.1, 33.2, 29.6 LR-MS-EI m/z: [M+], calculated for $\mathrm{C}_{8} \mathrm{H}_{10} \mathrm{~N}_{2} \mathrm{O} 150.1778$, found 150. IR (neat): $3137,1650,1632,1481,1429,1263,980,789$ $\mathrm{cm}^{-1}$.

### 2.5.4.16. Synthesis of $(\boldsymbol{E})$-4-(2,4,6-trimethoxyphenyl)-but-3-en-2-one (135), precursor

 to $\mathbf{1 3 6}$

See the general procedure for reaction above. 588.6 mg of 2,4,6trimethoxybenzaldehyde was used. The crude reaction mixture was purified via flash column chromatography with a $10-40 \%$ gradient of ethyl acetate in hexanes as eluent on silica gel to afford a white solid ( $599 \mathrm{mg}, 2.54 \mathrm{mmol}, 84 \%$ yield). ${ }^{1} \mathrm{H}$ NMR ( 400 MHz , $\left.\mathrm{CDCl}_{3}\right): \delta 7.93(\mathrm{~d}, \mathrm{~J}=16.7,1 \mathrm{H}), 7.05(\mathrm{~d}, \mathrm{~J}=16.7 \mathrm{~Hz}, 1 \mathrm{H}), 6.10(\mathrm{~s}, 2 \mathrm{H}), 3.86(\mathrm{~s}, 6 \mathrm{H}), 3.86$ (s, 3H), 2.33 (s, 3H). ${ }^{13} \mathrm{C}$ NMR (100.52 MHz, $\mathrm{CDCl}_{3}$ ): $\delta 200.7$, 163.1, 161.4, 135.1,
127.7, 105.7, 90.5, 55.8, 55.4, 27.0 IR (neat): 1595, 1565, 1334, 1264, 1249, 1231, 1154, $1111,830 \mathrm{~cm}^{-1}$.

### 2.5.5. Procedures for catalyst synthesis

### 2.5.5.1. Synthesis of (R)-2,2'-bis(methoxymethoxy)-1,1'-binaphthyl

The title compound was prepared via modification of the literature procedure. ${ }^{5}$ To a flame-dried flask fitted with a stir-bar and addition funnel was added NaH ( $60 \%$ dispersion in mineral oil, $840 \mathrm{mg}, 21 \mathrm{mmol}, 3$ equiv) and THF ( 30 mL ). The reaction was cooled to $0{ }^{\circ} \mathrm{C}$. R-(+)-BINOL ( $2.00 \mathrm{~g}, 7 \mathrm{mmol}, 1.0$ equiv) was then added as one portion. The reaction mixture was stirred at $0{ }^{\circ} \mathrm{C}$ for $1 \mathrm{~h} . \mathrm{MOM}-\mathrm{Br}(1.3 \mathrm{~mL}, 15.4 \mathrm{mmol}, 2.2$ equiv) was then added dropwise. The reaction was allowed to stir at $0^{\circ} \mathrm{C}$ for 10 min . After completion, the reaction mixture was quenched with saturated aq. $\mathrm{NH}_{4} \mathrm{Cl}$, extracted with $\mathrm{Et}_{2} \mathrm{O}$, and washed with brine. The organic layer was dried with $\mathrm{MgSO}_{4}$ and the solvent was removed via rotary evaporation. The crude product mixture was purified via column chromatography with a $10-20 \%$ gradient of ethyl acetate in hexanes as eluent on silica gel. ( $2.5162 \mathrm{~g}, 6.72 \mathrm{mmol}, 96 \%$ yield).

### 2.5.5.2. Synthesis of (R)-3,3'-diiodo-2,2'-bis(methoxymethoxy)-1,1'-binaphthyl

The title compound was prepared as previously described in the literature. ${ }^{5}$ To a flame-dried flask equipped with a stir bar was added ( $R$ )-2,2'-bis(methoxymethoxy)-1,1'binaphthyl obtained above ( $700 \mathrm{mg}, 1.87 \mathrm{mmol} 1.0$ equiv), and then $\mathrm{Et}_{2} \mathrm{O}(35 \mathrm{~mL}) .2 .5 \mathrm{M}$ $\mathrm{n}-\mathrm{BuLi}(2.3 \mathrm{~mL}, 5.61 \mathrm{mmol}, 3.0$ equiv) was added to the reaction. The reaction mixture was allowed to stir for 4 hours at room temperature. The reaction mixture was then cooled to $-78{ }^{\circ} \mathrm{C}$ and $\mathrm{I}_{2}(1.424 \mathrm{~g}, 5.61 \mathrm{mmol}, 3.0$ equiv) was added as one portion. The reaction was allowed to slowly warm to R.T. and stir overnight. After completion, the reaction mixture was quenched with saturated aq. $\mathrm{NH}_{4} \mathrm{Cl}$, extracted with $\mathrm{Et}_{2} \mathrm{O}$, and washed with $10 \%$ aq. $\mathrm{Na}_{2} \mathrm{~S}_{2} \mathrm{O}_{3}$ followed by brine solution. The organic layer was dried with $\mathrm{MgSO}_{4}$ and the solvent was removed via rotary evaporation. The crude product mixture was then purified via column chromatography with $5 \%$ ethyl acetate in hexanes as eluent on silica gel. ( $909.5 \mathrm{mg}, 1.45 \mathrm{mmol}, 78 \%$ yield).

### 2.5.5.3. Synthesis of (R)-3,3'-diiodo-1,1'-binaphthyl-2,2'-diol (105)

Compound $\mathbf{1 0 5}$ was prepared as previously described in the literature. ${ }^{5}$ To $(R)-3,3{ }^{\prime}-$ diiodo-2,2'-bis(methoxymethoxy)-1,1'-binaphthyl ( $300 \mathrm{mg}, 0.479 \mathrm{mmol}$ ) was added MeOH ( 2 mL ) and THF ( 2 mL ). Amberlyst 15 resin ( 600 mg ) was then added, and reaction was allowed to reflux at $65^{\circ} \mathrm{C}$ overnight. After completion, the resin was filtered off and the organic layer concentrated to reduce solvent amount. The organic layer was then passed through a silica plug with $5 \%$ ethyl acetate in hexanes as eluent to afford the hydrolyzed product. ( $214.8 \mathrm{mg}, 0.399 \mathrm{mmol}, 83 \%$ yield).

### 2.5.5.4. (R)-3,3'-bis(trifluoromethyl)-[1,1'-binaphthalene]-2,2'-diol (106)

106 was prepared as previously reported. ${ }^{6}$

### 2.5.5.5. Synthesis of (R)-2,2'-bis(methoxymethoxy)-3,3'-bis(perfluorophenyl)-1,1'binaphthyl

The title compound was prepared following the procedure previously described in the literature. ${ }^{6}$ To a flame-dried flask equipped with a magnetic stirbar was added ( $R$ )-2,2'-bis(methoxymethoxy)-1,1'-binaphthyl ( $1 \mathrm{~g}, 2.67 \mathrm{mmol}, 1$ equiv) and 16 ml THF. The reaction mixture was then cooled down to $0^{\circ} \mathrm{C}$ followed by the addition of $2.5 \mathrm{M} \mathrm{n}-\mathrm{BuLi}$ ( $3.2 \mathrm{ml}, 8 \mathrm{mmol}, 3$ equiv) and allowed to stir in 30 minutes. The reaction temperature was decreased to $-78{ }^{\circ} \mathrm{C}$ and hexafluorobenzene ( $2.2 \mathrm{ml}, 18.7 \mathrm{mmol}, 7$ equiv) was added dropwise via syringe. The reaction mixture was then warmed up to R.T. and stirred at this temperature for 12 h . After completion, the reaction was quenched with saturated aq. $\mathrm{NH}_{4} \mathrm{Cl}$, extracted with $\mathrm{Et}_{2} \mathrm{O}$, and wash with brine. After the removal of solvents via rotary evaporation, the reaction mixture was purified by column chromatography on silica gel using 5\% ethyl acetate in hexanes as eluent. The product was obtained as a
white solid ( $1.341 \mathrm{~g}, 1.9 \mathrm{mmol}, 71 \%$ yield) and the spectral data agreed with the reported data. ${ }^{6}$

### 2.5.5.6. Synthesis of ( $R$ )-3,3'-bis(perfluorophenyl)-1,1'-binaphthyl-2,2'-diol (100)

Compound $\mathbf{1 0 0}$ was prepared following the procedure described for the preparation of compound 105 above. 649.5 mg of SI-26 was used. The product was obtained as a white solid ( $553.4 \mathrm{mg}, 0.77 \mathrm{mmol}, 96 \%$ yield) after column chromatography using $5 \%$ ethyl acetate in hexanes as eluent. ${ }^{1} \mathrm{H}$ NMR $\left(400 \mathrm{MHz}, \mathrm{CDCl}_{3}\right): \delta 8.07(\mathrm{~s}, 2 \mathrm{H}), 7.97(\mathrm{~d}, \mathrm{~J}=7.3$ $\mathrm{Hz}, 2 \mathrm{H}), 7.48(\mathrm{~m}, 4 \mathrm{H}), 7.26(\mathrm{~d}, \mathrm{~J}=8.2 \mathrm{~Hz}, 2 \mathrm{H}), 5.29(\mathrm{~s}, 2 \mathrm{H}) .{ }^{13} \mathrm{C}$ NMR ( 100 MHz , $\mathrm{CDCl}_{3}$ ): $\delta 150.0,134.0,133.8,129.4,129.1,128.9,125.4,124.0,115.5,111.4 .{ }^{19} \mathrm{~F}$ NMR (470.6 MHz, $\left.\mathrm{CDCl}_{3}\right) \delta-58.48(\mathrm{t}, \mathrm{J}=21.8 \mathrm{~Hz}, 6 \mathrm{~F}),-140.0(\mathrm{dd}, \mathrm{J}=23.1,12.2 \mathrm{~Hz}, 2 \mathrm{~F})$, 140.3 (dd, J= 21.8, 12.2 Hz, 2F), -143.06- -143.33 (m, 4F). HR-MS-ESI m/z: $[\mathrm{M}+\mathrm{Na}]$, calculated for $\mathrm{C}_{34} \mathrm{H}_{12} \mathrm{~F}_{14} \mathrm{NaO}_{2} 741.0506$, found 741.0506 .
2.5.5.7. Synthesis of ( $R$ )-2,2'-bis(methoxymethoxy)-3,3'-bis(2,3,5,6-tetrafluoro-4-(trifluoromethyl)phenyl)-1,1'-binaphthyl

The title compound was prepared following the procedure previously described in the literature. ${ }^{7}$ To a flame-dried sealable flask equipped with a magnetic stirbar was added $\mathrm{K}_{2} \mathrm{CO}_{3}$ ( $737.7 \mathrm{mg}, 5.33 \mathrm{mmol}, 4.0$ equiv), $\mathrm{Ag}_{2} \mathrm{CO}_{3}(367.7 \mathrm{mg}, 1.33 \mathrm{mmol}, 1.0$ equiv), $\mathrm{S}-$ Phos ( $109.5 \mathrm{mg}, 0.27 \mathrm{mmol}, 0.2$ equiv), and $\mathrm{Pd}(\mathrm{OAc})_{2}(30 \mathrm{mg}, 0.13 \mathrm{mmol}, 0.1$ equiv). To this mixture 2,3,5,6-tetrafluorobenzotrfluoride ( $0.73 \mathrm{~mL}, 5.33 \mathrm{mmol}, 4.0$ equiv) and i$\operatorname{PrOAc}(1.5 \mathrm{~mL})$ were added. The reaction mixture was allowed to stir for 2 min at R.T. before the addition of 3,3 '-diiodo-2,2'-bis(methoxymethoxy)-1,1'-binaphthyl ( 835.6 mg , $1.33 \mathrm{mmol}, 1.0$ equiv). The reaction temperature was increased to $80^{\circ} \mathrm{C}$ and stirred at this temperature for 12 h . The reaction mixture was then cooled to R.T. and passed through a plug of Celite washing with EtOAc. After the removal of solvents via rotary evaporation, the reaction mixture was purified by column chromatography on silica gel using $5 \%$ ethyl acetate in hexanes as eluent. The product was obtained as a white solid ( $649.5 \mathrm{mg}, 0.805 \mathrm{mmol}, 60 \%$ yield). ${ }^{1} \mathrm{H}$ NMR ( $400 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ): $\delta 7.98(\mathrm{~s}, 2 \mathrm{H}), 7.94(\mathrm{~d}$, $\mathrm{J}=7.8 \mathrm{~Hz}, 2 \mathrm{H}), 7.52(\mathrm{dt}, \mathrm{J}=6.8,1.3 \mathrm{~Hz}, 2 \mathrm{H}), 7.42(\mathrm{dt}, \mathrm{J}=6.8,1.3 \mathrm{~Hz}, 2 \mathrm{H}), 7.32(\mathrm{~d}, \mathrm{~J}=$ 8.7, 2H), $4.48(\mathrm{~d}, \mathrm{~J}=5.9 \mathrm{~Hz}, 2 \mathrm{H}), 4.42(\mathrm{~d}, \mathrm{~J}=6.4 \mathrm{~Hz}, 2 \mathrm{H}), 2.62(\mathrm{~s}, 6 \mathrm{H}) .{ }^{13} \mathrm{C}$ NMR (100 $\left.\mathrm{MHz}, \mathrm{CDCl}_{3}\right): \delta 151.7,134.7,132.3,130.3,128.5,128.3,126.2,125.8,120.6,99.5,56.2$.

### 2.5.5.8. Synthesis of ( $\boldsymbol{R}$ )-3,3'-bis(2,3,5,6-tetrafluoro-4-(trifluoromethyl)phenyl)-1,1'-

 binaphthyl-2,2'-diol (107)

Compound 107 was prepared following the procedure described for the preparation of compound 105 above. 649.5 mg of ( $R$ )-2,2'-bis(methoxymethoxy)-3,3'-bis(2,3,5,6-
tetrafluoro-4-(trifluoromethyl)phenyl)-1,1'-binaphthyl was used. The product was obtained as a white solid ( $553.4 \mathrm{mg}, 0.77 \mathrm{mmol}, ~ 96 \%$ yield) after column chromatography using $5 \%$ ethyl acetate in hexanes as eluent. ${ }^{1} \mathrm{H}$ NMR ( 400 MHz , $\left.\mathrm{CDCl}_{3}\right) \delta 8.07(\mathrm{~s}, 2 \mathrm{H}), 7.97(\mathrm{~d}, \mathrm{~J}=7.3 \mathrm{~Hz}, 2 \mathrm{H}), 7.48(\mathrm{~m}, 4 \mathrm{H}), 7.26(\mathrm{~d}, \mathrm{~J}=8.2 \mathrm{~Hz}, 2 \mathrm{H})$, 5.29 (s, 2H). ${ }^{13} \mathrm{C}$ NMR ( $100 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 150.0,134.0,133.8,129.4,129.1,128.9$, 125.4, 124.0, 115.5, 111.4. ${ }^{19}$ F NMR ( $470.6 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ): $\delta-58.48(\mathrm{t}, \mathrm{J}=21.8 \mathrm{~Hz}, 6 \mathrm{~F})$, 140.0 (dd, J=23.1, 12.2 Hz, 2F), - 140.3 (dd, J=21.8, 12.2 Hz, 2F), $-143.06-143.33$ (m, 4F). HR-MS-ESI m/z: [M+Na], calculated for $\mathrm{C}_{34} \mathrm{H}_{12} \mathrm{~F}_{14} \mathrm{NaO}_{2} 741.0506$, found 741.0506.

### 2.5.5.9. Synthesis of (R)-bis(methoxymethoxy)-3,3'-bis(perfluorobiphenyl-4-yl)-1,1'-

 binaphthyl

To a flame-dried flask equipped with a magnetic stirbar was added $(R)-2,2^{\prime}-$ bis(methoxymethoxy)-1,1'-binaphthyl ( $500 \mathrm{mg}, 1.33 \mathrm{mmol}, 1$ equiv) and 8 ml THF. The reaction mixture was then cooled down to $0^{\circ} \mathrm{C}$ followed by the addition of $2.5 \mathrm{M} \mathrm{n}-\mathrm{BuLi}$ ( $2.7 \mathrm{ml}, 6.7 \mathrm{mmol}, 5$ equiv) and allowed to stir in 30 minutes. The reaction temperature was decreased to $-78{ }^{\circ} \mathrm{C}$ and decafluorobiphenyl ( $3.122 \mathrm{~g}, 9.34 \mathrm{mmol}, 7$ equiv) was added. The reaction mixture was then warmed up to R.T. and stirred at this temperature for 12 h . After completion, the reaction was quenched with saturated aq. $\mathrm{NH}_{4} \mathrm{Cl}$, extracted with $\mathrm{Et}_{2} \mathrm{O}$, and washed with brine. After the removal of solvents via rotary evaporation, the reaction mixture was purified by column chromatography on silica gel using 5\% ethyl acetate in hexanes as eluent. The product was obtained as a white solid ( $868 \mathrm{mg}, 0.86$
mmol, $65 \%$ yield). ${ }^{1} \mathrm{H}$ NMR ( $400 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ): $\delta 8.07(\mathrm{~s}, 2 \mathrm{H}), 7.96(\mathrm{~d}, \mathrm{~J}=8.2 \mathrm{~Hz}, 2 \mathrm{H}$ ), 7.52 (app.t., $\mathrm{J}=7.5 \mathrm{~Hz}, 2 \mathrm{H}$ ), 7.42 (app.t., $\mathrm{J}=7.5 \mathrm{~Hz}, 2 \mathrm{H}$ ), 7.35 (d, J= 8.7, 2H), 4.56 (d, J= $5.04 \mathrm{~Hz}, 2 \mathrm{H}), 4.48(\mathrm{~d}, \mathrm{~J}=5.95 \mathrm{~Hz}, 2 \mathrm{H}), 2.68(\mathrm{~s}, 6 \mathrm{H}) .{ }^{13} \mathrm{C}$ NMR ( $100 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ): $\delta$ $152.1,145.8,143.4,134.6,132.4,130.4,128.4,128.1,126.2,126.1,125.9,121.4,99.7$, 56.1.
2.5.5.10. Synthesis of $(R)-3,3$ '-bis(perfluoro-[1,1'-biphenyl]-4-yl)-1,1'-binaphthalene-2,2'-diol (108)

Compound 108 was prepared following the procedure described for the preparation of compound 105 above. 868 mg of ( $R$ )-bis(methoxymethoxy)-3,3'-bis(perfluorobiphenyl-4-yl)-1,1'-binaphthyl was used. The product was obtained as a white solid ( 361.7 mg , $0.395 \mathrm{mmol}, 46 \%$ yield) after column chromatography using $5 \%$ ethyl acetate in hexanes as eluent. ${ }^{1} \mathrm{H}$ NMR $\left(500 \mathrm{MHz}, \mathrm{CDCl}_{3}\right): \delta 8.13(\mathrm{~s}, 2 \mathrm{H}), 7.98($ app.d., $\mathrm{J}=7.4 \mathrm{~Hz}, 2 \mathrm{H}), 7.48$ $(\mathrm{m}, 4 \mathrm{H}), 7.30$ (app.d., $\mathrm{J}=7.4 \mathrm{~Hz}, 2 \mathrm{H}), 5.33(\mathrm{~s}, 2 \mathrm{H}) .{ }^{13} \mathrm{C} \mathrm{NMR}\left(100 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 150.3$, $134.1,133.8,129.2,129.1,129.0,125.2,124.1,116.2,111.4$. F NMR ( $376 \mathrm{MHz}, \mathrm{CDCl} 3$ ) $\delta-139.2(\mathrm{~d}, \mathrm{~J}=21.6 \mathrm{~Hz}, 2 \mathrm{~F}),-139.6(\mathrm{~d}, \mathrm{~J}=22.5 \mathrm{~Hz}, 2 \mathrm{~F}),-141.0-141.4(\mathrm{~m}, 8 \mathrm{~F}),-152.6$ (t, J= 20.8 Hz, 2F), -162.7--162.9 (m, 4F). HR-MS-ESI m/z: [M+Na], calculated for $\mathrm{C}_{44} \mathrm{H}_{12} \mathrm{~F}_{18} \mathrm{NaO}_{2}$ 937.0442, found 937.0426.

### 2.5.6. Procedures for boronic acid/ester synthesis

### 2.5.6.1. Synthesis of 2-methylprop-1-enylboronic acid

To a 250 ml -flask was added $\mathrm{LiCl}(1.008 \mathrm{~g}, 24 \mathrm{mmol}, 1.2$ equiv) and the flask was flamed-dried under high vacuum. The flask was then back-filled with Argon. 0.5 M 2-Methyl-1-propenyl magnesium bromide in THF ( $40 \mathrm{~mL}, 20 \mathrm{mmol}, 1.0$ equiv) and $\mathrm{Et}_{2} \mathrm{O}$ ( 50 ml ) were added. The solution was cooled to $-78^{\circ} \mathrm{C}$. Trimethyl borate ( $2.5 \mathrm{~mL}, 22$ mmol, 1.1 equiv) was added dropwise and the reaction was allowed to slowly warm to room temperature and stir overnight. The next day it was quenched with $1 \mathrm{M} \mathrm{HCl}(30 \mathrm{ml})$ until the reaction mixture became clear and then stirred for 1 hour. It was then extracted with $\mathrm{Et}_{2} \mathrm{O}$ (3 times), and washed with sat. aqueous $\mathrm{NaHCO}_{3}$ and Brine solution. The organic layer was dried with $\mathrm{Na}_{2} \mathrm{SO}_{4}$ and then concentrated via rotary evaporation. The crude solid was purified via column chromatography with a 20-30\% gradient of ethyl acetate in hexanes as eluent on silica gel to afford a white solid $(1.105 \mathrm{~g}, 11.06 \mathrm{mmol}$, $55 \%$ yield). All spectral properties were identical to those reported in the literature. ${ }^{8}$

### 2.5.6.2. Diisopropyl hex-1-ynylboronate

$$
\mathrm{C}_{4} \mathrm{H}_{9}=\mathrm{B}(\mathrm{OiPr})_{2}
$$

The title compound was prepared as previously reported. ${ }^{9}$

### 2.5.7. General procedure for conjugate addition

To a flask equipped with a stir bar and a condenser was added $4 \AA$ powdered molecular sieves ( 100 mg ) and the flask was flamed-dried under high vacuum. The flask was then back-filled with Argon. The heterocycle-appended enone ( $0.2 \mathrm{mmol}, 1.0$ equiv), $\mathrm{Mg}(t-\mathrm{BuO})_{2}(3.4 \mathrm{mg}, 0.02 \mathrm{mmol}, 0.1$ equiv), boronic acid ( 1.2 to 3 equiv), and BINOL catalyst ( $0.04 \mathrm{mmol}, 0.2$ equiv) were then added. Freshly dried toluene ( 4 mL ) was added and the reaction was heated to reflux in a $111^{\circ} \mathrm{C}$ oil bath and allowed to stir at this temperature (see each product for specific reaction times). After completion, methanol was added and the reaction mixture was concentrated via rotary evaporation. The crude reaction mixture was then dry-loaded onto silica gel and purified via flash column chromatography on silica gel with appropriate eluents. (See each product for specific eluent)

### 2.5.7.1. Synthesis of ( $E$ )-4-(furan-2-yl)-6-phenylhex-5-en-2-one (109)

See the general procedure for 1,4-conjugate addition reaction above. The crude reaction mixture was purified via flash column chromatography with a $30-60 \%$ gradient of dichloromethane in hexanes as eluent on silica gel. HPLC Chiralcel OD-H (hexane/i$\operatorname{PrOH}=90: 10-70-30,0.75 \mathrm{~mL} / \mathrm{min}, \mathrm{UV}-254$ detector). Trial $1: 47 \mathrm{mg}, 0.195 \mathrm{mmol}$, $97 \%$ yield; $97: 3$ er (with catalyst 100, 1.3 eq of boronic acid). Trial 2: $44.2 \mathrm{mg}, 0.184$ mmol, $92 \%$ yield; 95:5 er (with catalyst 100, 1.3 eq of boronic acid). Trial 3: 47.6 mg , $0.198 \mathrm{mmol}, 99 \%$ yield; $95: 5$ er (with catalyst 107, 1.3 eq of boronic acid). Trial 4: 47.5 $\mathrm{mg}, 0.197 \mathrm{mmol}, 98.8 \%$ yield, $96: 4$ (with catalyst $\mathbf{1 0 7}, 1.3 \mathrm{eq}$ of boronic acid). ${ }^{1} \mathrm{H}$ NMR $\left(400 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 7.33-7.36(\mathrm{~m}, 3 \mathrm{H}), 7.26-7.31(\mathrm{~m}, 2 \mathrm{H}), 7.21(\mathrm{tt}, \mathrm{J}=7.3,1.4 \mathrm{~Hz}, 1 \mathrm{H})$, $6.45(\mathrm{~d}, \mathrm{~J}=15.6 \mathrm{~Hz}, 1 \mathrm{H}), 6.31(\operatorname{app.dd}, \mathrm{~J}=1.8,3.2 \mathrm{~Hz}, 1 \mathrm{H}), 6.25(\mathrm{dd}, \mathrm{J}=16.0,7.8 \mathrm{~Hz}$, $1 \mathrm{H}), 6.05(\mathrm{~d}, \mathrm{~J}=3.2 \mathrm{~Hz}, 1 \mathrm{H}), 4.17(\mathrm{dd}, \mathrm{J}=7.8,14.6 \mathrm{~Hz}, 1 \mathrm{H}), 3.02(\mathrm{dd}, \mathrm{J}=6.4,16.5 \mathrm{~Hz}$, $1 \mathrm{H}), 2.85(\mathrm{dd}, \mathrm{J}=16.5,7.3 \mathrm{~Hz}, 1 \mathrm{H}), 2.15(\mathrm{~s}, 1 \mathrm{H}) .{ }^{13} \mathrm{C}$ NMR ( $100 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta$ 206.4, $155.8,141.6,136.9,131.4,129.2,128.6,127.6,126.4,110.3,105.5,47.3,37.8,30.6$. HR-MS-ESI m/z: [M+Na], calculated for $\mathrm{C}_{16} \mathrm{H}_{16} \mathrm{NaO}_{2}$ 263.1042, found 263.1041. IR (neat): $3031,2930,1712,1360,967,749,696 \mathrm{~cm}^{-1}$

### 2.5.7.2. Synthesis of $(\boldsymbol{E})$-6-(4-fluorophenyl)-4-(furan-2-yl)hex-5-en-2-one (110)

See the general procedure for 1,4-conjugate addition reaction above. The crude reaction mixture was purified via flash column chromatography with a $30-60 \%$ gradient of dichloromethane in hexanes as eluent on silica gel. HPLC Chiralcel OD-H (hexane/i-
$\operatorname{PrOH}=90: 10-70-30,0.75 \mathrm{~mL} / \mathrm{min}, \mathrm{UV}-254$ detector). Trial $1: 44.9 \mathrm{mg}, 0.174 \mathrm{mmol}$, $87 \%$ yield; 99.3:0.7 er (with cat. 100, 1.3 eq of boronic acid). Trial 2: $43.1 \mathrm{mg}, 0.167$ mmol, $84 \%$ yield; 99.9:0.1 er (with cat. 100, 1.3 eq of boronic acid). ${ }^{1} \mathrm{H}$ NMR ( 400 MHz , $\left.\mathrm{CDCl}_{3}\right) \delta$ 7.26-7.34 (m, 3H), 6.94-6.99 (dapp.t, $\left.\mathrm{J}=8.7 \mathrm{~Hz}, 2 \mathrm{H}\right), 6.39(\mathrm{~d}, \mathrm{~J}=16.0 \mathrm{~Hz}$, $1 \mathrm{H}), 6.3(\mathrm{dd}, \mathrm{J}=3.2,2.3 \mathrm{~Hz}, 1 \mathrm{H}), 6.14(\mathrm{dd}, \mathrm{J}=15.6,7.8 \mathrm{~Hz}, 1 \mathrm{H}), 6.06(\mathrm{~d}, \mathrm{~J}=3.2 \mathrm{~Hz}$, $1 \mathrm{H}), 4.15(\mathrm{dd}, \mathrm{J}=7.3,14.2 \mathrm{~Hz}, 1 \mathrm{H}), 3.00(\mathrm{dd}, \mathrm{J}=16.5,6.9 \mathrm{~Hz}, 1 \mathrm{H}), 2.84(\mathrm{dd}, \mathrm{J}=16.9$, 7.3, 1H), $2.14(\mathrm{~s}, 3 \mathrm{H}) .{ }^{13} \mathrm{C}$ NMR (100 MHz, $\left.\mathrm{CDCl}_{3}\right) \delta 206.3,163.2,161.0,155.7,144.6$, $133.4,130.2,129.0,127.9,115.5,110.3,105.5,47.2,37.7,30.6$. HR-MS-ESI m/z: [M+Na], calculated for $\mathrm{C}_{16} \mathrm{H}_{15} \mathrm{FNaO}_{2}$ 281.0948, found 281.0948. IR (neat): 2930, 1712, $1600,1509,1226,970,832,603 \mathrm{~cm}^{-1}$

### 2.5.7.3. Synthesis of ( $\boldsymbol{E}$ )-4-(furan-3-yl)-6-phenylhex-5-en-2-one (111)

See the general procedure for 1,4-conjugate addition reaction above. The crude reaction mixture was purified via flash column chromatography with a $30-60 \%$ gradient of dichloromethane in hexanes as eluent on silica gel. HPLC Chiralcel OD-H (hexane/i$\operatorname{PrOH}=90: 10-70-30,0.75 \mathrm{~mL} / \mathrm{min}, \mathrm{UV}-254$ detector $).$ Trial $1: 44.2 \mathrm{mg}, 0.184 \mathrm{mmol}$, $92 \%$ yield; $99: 1$ er (with cat. 100, 1.3 eq of boronic acid). Trial 2: $90.1 \mathrm{mg}, 0.375 \mathrm{mmol}$, $94 \%$ yield; $98: 2$ er (with cat. 100, 0.4 mmol enone, 1.3 eq of boronic acid). Trial 3: 47.7 $\mathrm{mg}, 0.198 \mathrm{mmol}, 98 \%$ yield; $98: 2$ er (with cat. 100, 1.3 eq of boronic acid). ${ }^{1} \mathrm{H}$ NMR $\left(400 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 7.30(\mathrm{~m}, 7 \mathrm{H}), 6.41(\mathrm{~d}, \mathrm{~J}=16.0 \mathrm{~Hz}, 1 \mathrm{H}), 6.31(\mathrm{~s}, 1 \mathrm{H}), 6.25(\mathrm{dd}, \mathrm{J}=$ $16.0,7.8,1 \mathrm{H}), 4.05(\mathrm{q}, \mathrm{J}=14.2,7.3,1 \mathrm{H}), 2.84(\mathrm{~d}, \mathrm{~J}=7.3,2 \mathrm{H}), 2.14(\mathrm{~s}, 3 \mathrm{H}) .{ }^{13} \mathrm{C}$ NMR
(100 MHz, $\mathrm{CDCl}_{3}$ ) $\delta 206.9,143.3,138.9,137.0,131.5,130.4,128.6,127.5,126.3,110.0$, 49.1, 34.9, 30.8. HR-MS-ESI m/z: [M+Na], calculated for $\mathrm{C}_{16} \mathrm{H}_{16} \mathrm{NaO}_{2}$ 263.1042, found 263.1041. IR (neat): $3034,2937,1712,1362,1161,969,753,697 \mathrm{~cm}^{-1}$.

### 2.5.7.4. Synthesis of 4-(furan-3-yl)-6-methylhept-5-en-2-one (112)

See the general procedure for 1,4-conjugate addition reaction above, chlorobenzene was used as solvent at $80^{\circ} \mathrm{C}$. The crude reaction mixture was purified via flash column chromatography with a $30-60 \%$ gradient of dichloromethane in hexanes as eluent on silica gel. HPLC Chiralcel OD-H (hexane/i-PrOH $=90: 10-70-30,0.75 \mathrm{~mL} / \mathrm{min}$, UV230 detector). Trial 1: $34.3 \mathrm{mg}, 0.179 \mathrm{mmol}, 89 \%$ yield; 93.9:6.1er (with cat. 107, 1.3 eq of boronic acid). Trial 2: $34.4 \mathrm{mg}, 0.179 \mathrm{mmol}, 89 \%$ yield; $94: 6$ er (with cat. 107, 1.3 eq of boronic acid). ${ }^{1} \mathrm{H}$ NMR ( $500 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 7.32(\mathrm{t}, \mathrm{J}=1.6 \mathrm{~Hz}, 1 \mathrm{H}), 7.17(\mathrm{~s}, 1 \mathrm{H}), 6.24$ $(\mathrm{s}, 1 \mathrm{H}), 5.11(\mathrm{td}, \mathrm{J}=9.7,1.2 \mathrm{~Hz}, 1 \mathrm{H}), 3.98(\mathrm{q}, \mathrm{J}=16.6,6.9,1 \mathrm{H}), 2.71(\mathrm{dd}, \mathrm{J}=16.0,6.9 \mathrm{~Hz}$, $1 \mathrm{H}), 2.61(\mathrm{dd}, \mathrm{J}=16.0,8.0 \mathrm{~Hz}, 1 \mathrm{H}), 2.10(\mathrm{~s}, 3 \mathrm{H}), 1.69(\mathrm{~s}, 3 \mathrm{H}), 1.55(\mathrm{~s}, 3 \mathrm{H}) .{ }^{13} \mathrm{C}$ NMR (125.77 MHz, $\mathrm{CDCl}_{3}$ ) $\delta 207.5,143.1,138.4,133.5,133.0,126.3,109.7,50.1,30.9,25.8$, 18.1. HR-MS-ESI m/z: [M+Na], calculated for $\mathrm{C}_{12} \mathrm{H}_{16} \mathrm{NaO}_{2}$ 215.1042, found 215.1039. IR (neat): 2985, 2937, 1713, 1154, 1154, 1020, $971,792 \mathrm{~cm}^{-1}$

### 2.5.7.5. Synthesis of 4-(furan-3-yl)dec-5-yn-2-one (113)

See the general procedure for 1,4-conjugate addition reaction above. 3 equivalents of boronic ester were used. The crude reaction mixture was purified via flash column chromatography with a $30-60 \%$ gradient of dichloromethane in hexanes as eluent on silica gel. HPLC Chiralcel OD-H (hexane/i-PrOH $=90: 10-70-30,0.75 \mathrm{~mL} / \mathrm{min}$, UV190 detector). Trial 1: $43.4 \mathrm{mg}, 0.199 \mathrm{mmol}, 99 \%$ yield; $95: 5$ er (with cat. 107, 3 equivalent of boronic ester). Trial 2: $43.3 \mathrm{mg}, 0.198 \mathrm{mmol}, 99 \%$ yield; $95: 5 \mathrm{er}$ (with cat. 107, 3 equivalent of boronic ester). ${ }^{1} \mathrm{H}$ NMR $\left(400 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 7.32(\mathrm{ss}, 2 \mathrm{H}), 6.32(\mathrm{~s}$, $1 \mathrm{H}), 4.04(\mathrm{tt}, \mathrm{J}=9.0,2.5 \mathrm{~Hz}, 1 \mathrm{H}), 2.86(\mathrm{dd}, \mathrm{J}=16.5,7.8 \mathrm{~Hz}, 1 \mathrm{H}), 2.15(\mathrm{~s}, 3 \mathrm{H}), 1.40(\mathrm{~m}$, $6 \mathrm{H}), 0.89(\mathrm{t}, \mathrm{J}=7.3 \mathrm{~Hz}, 3 \mathrm{H}) .{ }^{13} \mathrm{C}$ NMR ( $100 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 206.3,143.1,139.5,125.9$, 109.7, 82.2, 80.1, 50.8, 31.0, 30.7, 23.8, 22.0, 18.4, 13.7. HR-MS-ESI m/z: $[\mathrm{M}+\mathrm{Na}]$, calculated for $\mathrm{C}_{14} \mathrm{H}_{18} \mathrm{NaO}_{2}$ 241.1199, found 241.1198. IR (neat): 2939, 2879, 2348, 1715, $1359,1163,1033,655 \mathrm{~cm}^{-1}$.

### 2.5.7.6. Synthesis of (E)-6-(furan-3-yl)-4-((E)-styryl)hex-5-en-2-one (114)

See the general procedure for 1,4-conjugate addition reaction above. The crude reaction mixture was purified via flash column chromatography with a $30-60 \%$ gradient of dichloromethane in hexanes as eluent on silica gel. HPLC Chiralcel OD-H (hexane/i$\operatorname{PrOH}=90: 10-70-30,0.75 \mathrm{~mL} / \mathrm{min}, \mathrm{UV}-254$ detector). Trial $1: 39.3 \mathrm{mg}, 0.147 \mathrm{mmol}$, $74 \%$ yield; 98:2 er (with cat. 100, 1.3 eq of boronic acid). Trial 2: $39.4 \mathrm{mg}, 0.147 \mathrm{mmol}$, $74 \%$ yield; $98: 2$ er (with cat. 100, 1.3 eq of boronic acid). Trial 3: $39.9 \mathrm{mg}, 0.15 \mathrm{mmol}$, $75 \%$ yield; $97: 3$ er (with cat. 107, 1.3 eq of boronic acid). Trial 4: $40 \mathrm{mg}, 0.15 \mathrm{mmol}$,
$75 \%$ yield; 98:2 er (with cat. 107, 1.3 eq of boronic acid). ${ }^{1} \mathrm{H}$ NMR $\left(400 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta$ 7.22-7.40 (m, 7H), $6.50(\mathrm{~s}, 1 \mathrm{H}), 6.42(\mathrm{~d}, \mathrm{~J}=16.0 \mathrm{~Hz}, 1 \mathrm{H}), 6.30(\mathrm{~d}, \mathrm{~J}=16.0,7.3 \mathrm{~Hz}, 1 \mathrm{H})$, $6.16(\mathrm{dd}, \mathrm{J}=16.0,7.3 \mathrm{~Hz}, 1 \mathrm{H}), 5.91(\mathrm{dd}, \mathrm{J}=16.0,6.9 \mathrm{~Hz}, 1 \mathrm{H}), 3.59(\mathrm{~m}, 1 \mathrm{H}), 2.67(\mathrm{~d}, \mathrm{~J}=$ 6.9, 2H), 2.16 (s, 3H). ${ }^{13} \mathrm{C}$ NMR ( $100 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta$ 207.0, 143.5, 140.2, 137.1, 131.1, 130.7, 130.5, 128.6, 127.4, 120.3, 107.5, 48.7, 41.3, 30.8. HR-MS-ESI m/z: $[\mathrm{M}+\mathrm{Na}]$, calculated for $\mathrm{C}_{18} \mathrm{H}_{18} \mathrm{NaO}_{2}$ 289.1199, found 289.1199. IR (neat): 2976, 1710, 1361, 1260, 1161, 1032, 752, $699 \mathrm{~cm}^{-1}$

### 2.5.7.7. Synthesis of 6-methyl-4-(thiophen-2-yl)hept-5-en-2-one (115)

See the general procedure for 1,4-conjugate addition reaction above. The crude reaction mixture was purified via column chromatography with a $30-50 \%$ gradient of dichloromethane in hexanes as eluent on silica gel. Trial $1: 30.7 \mathrm{mg}, 0.147 \mathrm{mmol}, 75 \%$ yield; 94:6 er (with $15 \mathrm{~mol} \%$ catalyst 100, 4 equiv of boronic acid, $17 \mathrm{~h}, 29.7 \mathrm{mg}$ of starting material). Trial 2: $26 \mathrm{mg}, 0.125 \mathrm{mmol}, 70 \%$ yield; $87: 13$ er (with $15 \mathrm{~mol} \%$ catalyst 100, 4 equiv of boronic acid, $17 \mathrm{~h}, 27.2 \mathrm{mg}$ of starting material). Trial $3: 44.7 \mathrm{mg}$, $0.214 \mathrm{mmol}, 99 \%$ yield; $96: 4$ er (with catalyst 107, 2 equiv of boronic acid, $2 \mathrm{~h}, 33 \mathrm{mg}$ of starting material). ### 2.5.7.26. Synthesis of 6-methyl-4-(1-methyl-1H-imidazol-2-yl)hept-5-en-2-one (134)

See the general procedure for 1,4-conjugate addition reaction above. The crude reaction mixture was purified via flash column chromatography with a $100 \%$ ethyl acetate as eluent on silica gel. HPLC Chiralpak ID (hexane/EtOH/Et ${ }_{3} \mathrm{~N}=70: 29.5: 0.5,1.0$ $\mathrm{mL} / \mathrm{min}$, UV-230 detector). Trial 1: $38.8 \mathrm{mg}, 0.188 \mathrm{mmol}, 94 \%$ yield; $96: 4 \mathrm{er}$ (with cat. 107, 1.3 eq of boronic acid). Trial 2: $37 \mathrm{mg}, 0.180 \mathrm{mmol}, 90 \%$ yield; $96: 4 \mathrm{er}$ (with cat. 107, 1.3 eq of boronic acid). ${ }^{1} \mathrm{H}$ NMR ( $400 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 6.85(\mathrm{~d}, \mathrm{~J}=0.92 \mathrm{~Hz}, 1 \mathrm{H}), 6.70$ $(\mathrm{d}, \mathrm{J}=1.5 \mathrm{~Hz}, 1 \mathrm{H}), 5.08(\mathrm{dm}, \mathrm{J}=9.6,1 \mathrm{H}), 4.14(\mathrm{ddd}, \mathrm{J}=10.0,8.2,5.9 \mathrm{~Hz}, 1 \mathrm{H}), 3.54(\mathrm{~s}$, $3 \mathrm{H}), 3.32(\mathrm{dd}, \mathrm{J}=17.4,8.2 \mathrm{~Hz}, 1 \mathrm{H}), 2.69(\mathrm{dd}, \mathrm{J}=17.4,5.5 \mathrm{~Hz}, 1 \mathrm{H}), 2.12(\mathrm{~s}, 3 \mathrm{H}), 1.74(\mathrm{~d}$, $\mathrm{J}=1.4 \mathrm{~Hz}, 3 \mathrm{H}), 1.65(\mathrm{~d}, \mathrm{~J}=1.4 \mathrm{~Hz}, 3 \mathrm{H}) .{ }^{13} \mathrm{C} \mathrm{NMR}\left(100 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 207.6,149.8$, $132.8,126.9,124.5,120.6,47.6,32.6,31.7,30.8,25.7,18.2$. HR-MS-ESI m/z: $[\mathrm{M}+\mathrm{H}]$, calculated for $\mathrm{C}_{12} \mathrm{H}_{19} \mathrm{~N}_{2} \mathrm{O}$ 207.1492, found 207.1492. IR (neat) 2976, 2927, 1713, 1492, $1363,1156,1133,726 \mathrm{~cm}^{-1}$.

### 2.5.7.27. Synthesis of 6-methyl-4-(2,4,6-trimethoxyphenyl)hept-5-en-2-one (136)

See the general procedure for 1,4-conjugate addition reaction above. 2 equivalent of boronic acid was used. The crude reaction mixture was purified via column chromatography with a $10 \%$ ethyl acetate in hexanes as eluent on silica gel. Trial 1: $50.6 \mathrm{mg}, 0.173 \mathrm{mmol}, 86 \%$ yield; $98: 2$ er (with catalyst $\mathbf{1 0 0}, 4 \mathrm{~h}, 47.4 \mathrm{mg}$ of starting material). Trial 2: $44.1 \mathrm{mg}, 0.151 \mathrm{mmol}, 75 \%$ yield; $88: 12$ er (with catalyst 10d, $4 \mathrm{~h}, 47.2$ mg of starting material). Trial $3: 53.7 \mathrm{mg}, 0.184 \mathrm{mmol}, 92 \%$ yield; $97: 3 \mathrm{er}$ (with catalyst 107, $1 \mathrm{~h}, 47.3 \mathrm{mg}$ of starting material). Trial $4: 58 \mathrm{mg}, 0.198 \mathrm{mmol}, 99 \%$ yield; $99: 1 \mathrm{er}$ (with catalyst 10e, $1 \mathrm{~h}, 47.1 \mathrm{mg}$ of starting material). ${ }^{1} \mathrm{H} \mathrm{NMR}\left(400 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 6.09$ $(\mathrm{s}, 2 \mathrm{H}), 5.49$ (app.d., J=9.6 Hz, 1H), $4.65(\mathrm{q}, \mathrm{J}=7.8 \mathrm{~Hz}, 1 \mathrm{H}), 3.80(\mathrm{~s}, 6 \mathrm{H}), 3.77(\mathrm{~s}, 3 \mathrm{H})$, 2.87 (dd, J= 15.1, 7.8 Hz, 1H), 2.78 (dd, J= 14.6, $6.8 \mathrm{~Hz}, 1 \mathrm{H}$ ), $2.04(\mathrm{~s}, 3 \mathrm{H}), 1.67(\mathrm{~s}, 3 \mathrm{H})$, 1.62 (s, 3H). ${ }^{13} \mathrm{C}$ NMR ( $100 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 209.5,159.4,158.6,131.2,126.8,113.0$, $91.2,55.8,55.3,48.5,30.1,30.0,25.9,17.9$. IR (neat): $1709,1605,1591,1458,1418$, $1224,1204,1149,1115,814 \mathrm{~cm}^{-1}$

### 2.5.8. General procedure for cuprate conjugate addition

To a flame dried flask equipped with stir bar was added $\mathrm{CuBr} . \mathrm{Me}_{2} \mathrm{~S}$ and 4 ml THF. The temperature was then cooled down to $-78{ }^{\circ} \mathrm{C}$. 2-Methyl-1-propenylmagnesium bromide was added dropwise and the rection mixture was then allowed to stir at that
temperature for 30 minutes. A solution of enone ( 2 mmol in 5 ml THF) was added via cannula and stirred for 30 minutes. After then, the reaction mixture was warmed up to R.T., quenched with 2 N HCl and extracted with $\mathrm{Et}_{2} \mathrm{O}$. The organic layer was dried over $\mathrm{MgSO}_{4}$ and concentrated via rotary evaporation. The crude product was purified via flash column chromatography on silica gel with appropriate eluents. ${ }^{10}$

## Chapter 3

## Experimental mechanistic study of the BINOL-catalyzed conjugate addition of vinylboronic acids to enones ${ }^{1}$

### 3.1. Background

In the first chapter, we introduced the seminal work by Chong on the BINOLcatalyzed conjugate addition of boronic esters to enones and in the second our work in developing this chemistry to access different chiral heterocyclic structures. This section will provide a complete historical picture of the mechanistic aspects of this powerful asymmetric strategy.

### 3.1.1. H.C. Brown's work

In 1967, Brown and coworkers showed that alkylboranes could undergo a conjugate addition to methyl vinyl ketone $^{2}$ and acrolein $^{3}$ to generate elongated ketones and aldehydes (Scheme 3.1.1.1). The method was later performed on 2-bromoacrolein ${ }^{4}$ to form different $\alpha$-bromo carbonyl compounds which were very useful but difficult to obtain considering the state of the art at the time (Scheme 3.1.1.1). This breakthrough allowed for the use of a mild boron nucleophile that was advantageous over the utilization of organometallic reagents that were typically too harsh for 1,4-addition, especially towards enal substrates.

Scheme 3.1.1.1. Conjugate addition of alkylboranes to unsaturated carbonyl compounds

The transformation was subsequently proven to go through a radical process. ${ }^{5}$ Specifically, inhibition was observed with the addition of galvinoxyl, a radical scavenger, to the reaction. To further support this hypothesis, they also carried out the reactions in the presence of peroxide or ultraviolet light ${ }^{6}$ on a number of less reactive substrates, and a great boost in yield was observed under the given conditions. Finally, they showed that the slow addition of external oxygen was sufficient for the efficient formation of the products especially for difficult substrates as mentioned above. ${ }^{7}$

In light of the successfully established method, the Brown group proceeded to investigate the reactivity of vinylboranes to transfer the vinyl group to $\alpha, \beta$-unsaturated ketones. ${ }^{8}$ Although attempts to achieve the same free radical transformation were not successful, they found the reactions were highly operative in thermal conditions. An interesting observation was that cyclic enones that could not adopt an s-cis conformation gave a complex mixture without any trace of the desired products. This implied a particular cyclic transition state that can transfer the vinyl from boron to carbon with the retention of its stereochemistry (Scheme 3.1.1.2).

Scheme 3.1.1.2. 1,4-Addition of vinylboranes to unsaturated carbonyl compounds.

These seminal works by H.C. Brown initiated a research trend in developing methods for organoboron in conjugate addition reactions. The following sections describe this chemistry in terms of scope and mechanistic insights.

### 3.1.2. Suzuki’s work

In the vinylation of enones by Brown, the vinylboranes were accessed via the hydroboration of alkynes by $9-\mathrm{BBN}$, which gave exclusively $\alpha, \beta$-disubstituted alkenylboranes (Scheme 3.1.1.2). This restriction set a limitation of the strategy in that highly substituted vinylboranes, especially trisubstituted vinylboranes, were left out of the scope. In 1985, Suzuki et al. described their elegant solution for the problem in which haloborations were performed on terminal alkynes followed by the standard conjugate addition to methyl vinyl ketone. The halo group on the addition product was subsequently manipulated by means of some coupling transformations to achieve chemical structures with a highly substituted olefin moiety at the terminal. ${ }^{9}$ The utility of the method was
demonstrated by the synthesis of the terpenoid trans-nerodinol in excellent yield and stereoselectivity (Scheme 3.1.2.1).

Scheme 3.1.2.1. Application of conjugate addition of halovinylboranes to enones in the synthesis of trans-nerolidol.

It is worth noticing that the reactions require an excess of $9-\mathrm{BBN}$ in order to take place smoothly, indicating a Lewis acid promoted mechanism. This was later reaffirmed in a 1990 report of the conjugate addition of vinylboronic esters to enones in which the reactions only proceeded in the presence of stoichiometric $\mathrm{BF}_{3}$ etherate (Scheme 3.1.2.2). ${ }^{10}$ This observation in addition to the inertness of cyclic enones made them believe that the reaction should proceed initially with the activation of the vinylboronic ester by $\mathrm{BF}_{3}$ etherate to form a stronger Lewis acid 159 , followed by a closed sixmembered ring transition state for the C-C bond formation. Although there was not evidence reported for the proposed pathway, they observed the intermediate 159 when carrying out the reaction in the absence of the enone.

Scheme 3.1.2.2. Conjugate addition of vinyl boronic esters to enones and proposed cyclic transition state.

Taking advantage of the novel method developed by H.C. Brown in $1988^{11}$ to prepare alkynylboronic esters, the Suzuki group was able to introduce a number of alkynyl groups to enones (Scheme 3.1.2.3). ${ }^{12}$ Unsurprisingly, all the mechanism related observations were in accord with those described in their proceeding publication.

Scheme 3.1.2.3. Conjugate addition of alkynylboronic esters to enones.

Later, they disclosed the extension to the use of different alkenylboronic acids using cyanuric fluoride to activate the boronic acids in the same way as $\mathrm{BF}_{3}$ does to boronic esters (Scheme 3.1.2.4). ${ }^{13}$ This could be perceived as an improvement since $\mathrm{BF}_{3}$ etherate could cause undesired side products and boronic acids are generally more stable and easier to handle than the esters.

Scheme 3.1.2.4. Conjugate addition of vinylboronic acids to enones facilitated by cyanuric fluoride.

### 3.1.3. Chong's work and the proposed mechanism

In 2000, two years after Suzuki revealed his work with boronic acids, Chong and coworkers described the employment of stoichiometric BINOL to facilitate the enantioselective conjugate addition of various alkynyl boronate salts to chalcone substrates (Scheme 3.1.3.1). ${ }^{14}$ When BINOL was treated with enone and 169 without the $\mathrm{BF}_{3} \cdot \mathrm{Et}_{2} \mathrm{O}$, the reaction did not proceed. With a stoichiometric amount of $\mathrm{BF}_{3} \cdot \mathrm{Et}_{2} \mathrm{O}$, a smooth transformation took place with good yield and great selectivity. It is also noteworthy that cyclic enones such as cyclohexenone are completely unreactive under their standard conditions. This is in agreement with the observations from Brown and Suzuki. With the configuration of the product defined by X-ray analysis and the above
observations, they proposed a transition state that invokes a six-membered ring conformation formed by the trivalent boron species 173 and the enone.

Scheme 3.1.3.1. Asymmetric conjugate addition of alkynylborates to enones and proposed transition state.

In their subsequent reports where they demonstrated the catalytic activity of BINOL in the reaction of alkynyl ${ }^{15}$ and vinyl ${ }^{16}$ boronic esters, they proposed a similar transition state for the reactions.

A catalytic cycle was also postulated to rationalize the catalytic ability of the $\mathrm{I}_{2}$ BINOL (Scheme 3.1.3.2). To begin, a double exchange between the BINOL and the boronic ester occurs to form the trivalent boronate $\mathbf{1 7 5}$ with the concurrent releasing of two alcohol molecules. The newly formed boronate possesses a greater Lewis acidity than the parent boronic ester and will bind to the carbonyl oxygen more strongly. At this point, the carbon-carbon bond formation takes place to form the intermediate 177, which
engages in the ligand exchange/disproportionation with another alkynylboronic ester to yield intermediate $\mathbf{1 7 8} .178$ will then afford the product via protonolysis process.

Scheme 3.1.3.2. Chong's proposed catalytic cycle of the BINOL catalyzed conjugate addition of alkynylboronic esters to enones.

An NMR study was also carried out showing that the equilibrium between boronate $\mathbf{1 7 4}$ and $\mathbf{1 7 5}$ is established quickly at room temperature. This leaves either the addition or the disproportionation step to be rate determining. However, the latter is less likely to be the slowest step due to the dependence of the reaction rate on the aryl groups attached to the $\beta$-position of the enones.

### 3.1.4. Theoretical study

In 2006, Pellegrinet and Goodman carried out a calculational study ${ }^{17}$ on the mechanistic pathway proposed by Chong (Scheme 3.1.3.2). The calculation confirmed the catalytic capability of BINOL. Specifically, the energy barrier for the reaction of the enone with the activated trivalent boronate $\mathbf{1 7 5}$ is much lower than that for the enone
with the starting boronic ester. The distance between the boron and the carbonyl oxygen in the transition state of the reaction of the enone and $\mathbf{1 7 5}$ is also shorter than that in the transition state with $\mathbf{1 7 4}$. This result reaffirmed the higher Lewis acidity of $\mathbf{1 7 5}$ than the boronic ester. In addition, the complexation between 174 and the enone was shown to lower the LUMO of the enone and hence facilitate the addition step. Finally, the facial selectivity was correctly reproduced, with a calculated energy difference between the two diasteromeric transition states of $1.18 \mathrm{kcalmol}^{-1}$ of the model system.

In 2008, they performed the same work on the reaction of alkenylboronic esters. This study gave a thorough computational analysis on both the transition state and the catalytic cycle of the reaction. ${ }^{18}$ Contrary to the previously proposed chair-like six-membered ring transition state, the reaction was determined to proceed through a sofa-like conformation in which five atoms of the six-membered ring were actually in the same plane (Scheme 3.1.4.1). Like the previous theoretical study, the computed facial selectivity was in the great agreement with experimental data from Chong's study.

Scheme 2.1.4.1. Calculated sofa-like transition state.

The computational analysis of the reaction coordinates revealed a strong support for the catalytic pathway proposed by Chong with a more detailed mechanism (Scheme
2.1.4.2). The reversible double exchange of methoxy groups with the BINOL that gives rise to the highly acidic boronate species $\mathbf{1 8 2}$ was confirmed to be more favorable than the mono exchange pathway proposed by Schaus and coworkers in their asymmetric allylation of ketones ${ }^{19}$ and acyl imines ${ }^{20}$. The addition process in Chong's cycle was broken into two steps in which the activated boronate $\mathbf{1 8 2}$ coordinated to the enone carbonyl to form the highly bound complex 184, and this complex in turn engages in carbon-carbon bond formation. Chong's proposal of the addition step being ratedetermining was also confirmed by having the highest activation energy. Intrigued by these results on the rate determining step of Chong's work and the theoretical study, we decided to study the mechanism of the transformation by an experimental approach.

Scheme 2.1.4.2. Detailed catalytic cycle supported by theoretical study.

### 3.2. Approach

### 3.2.1. Postulated mechanistic scheme

We anticipated that the use of boronic acids in our methods in place of boronic esters did not alter the mechanism of the reaction. We, therefore, come up with a revised catalytic cycle (Scheme 3.2.1) that accommodates the incorporation of boronic acids in the pathway derived from the theoretical study mentioned above. In addition, the monodentate coordination associated with an intramolecular hydrogen bond as proposed by Schaus cannot be excluded. Finally, because boronic acids are in equilibrium with the corresponding boroxines, we cannot rule out the possibility of the generation of activated boronates from boroxine.

Scheme 3.2.1. Revised scheme for the use of boronic acids.

The fact that the electronic nature of the $\beta$-aryl groups have great impact on the reaction rate indicates that the formation of $\mathbf{1 9 0}$ or $\mathbf{1 9 1}$ from BINOL is not the rate
determining step. The same argument can also be applied for the protonolysis being a rapid process since the stability of the boron enolate 194 is not affected by the $\beta$-aryl groups. Furthermore, the presence of super-stoichiometric amounts of boronic acid would also accelerate this step. As a consequence, either the formation of complex 193 or the carbon-carbon bond formation for 194 would be the slowest step. In either scenario, the electronic effects from the enone and/or ketone aryl groups would influence the reaction rate. Therefore, we decided to implement a Hammett plot analysis to verify the rate determining step.

### 3.2.2. Hammett plot

The Hammett plots are generally used for those reactions whose mechanisms express a rate dependence on the electronic nature of the substituents. Hammett established a quantified scale to evaluate the ability of substituents to exert their electronic demand. In order to do that, he measured the acidity constants of different benzoic acids bearing different substituents at meta or para positions (Scheme 3.2.2.1). Ortho substituents were not examined to eliminate any possible steric effects.

Scheme 3.2.2.1. Acid dissociation of substituted benzoic acids.

The acidity of each substituted benzoic acid was then compared with the parent acid via equation 3.2.1. The $\sigma_{\mathrm{x}}$ value, which is called substituent parameter, reflects quantitatively the capability of each substituent to withdraw or donate the electrons. An
electron withdrawing group will make the acid more acidic, the ratio $K_{x} / K_{H}$ will be greater than 1 , and consequently a positive $\sigma_{x}$ will be obtained. In the opposite sense a negative $\sigma_{x}$ is produced by an electron donating group.

$$
\begin{equation*}
\log \left(K_{x} / K_{H}\right)=\sigma_{x} \tag{3.2.1}
\end{equation*}
$$

The established set of $\sigma$ values can then serve to investigate the electronic sensitivity of reactions different from acid dissociation. Specifically, the Hammett relationship given in equation 3.2.2 will be utilized and a plot of $\log \left(\mathrm{k}_{\mathrm{x}} / \mathrm{k}_{\mathrm{H}}\right)$ or $\log \mathrm{k}_{\mathrm{x}}$ versus $\sigma_{\mathrm{x}}$ is made to determine the $\rho$ value, which is the slope of the graph.

$$
\begin{equation*}
\log _{k_{x}}\left(\text { or } \log \left(k_{x} / k_{H}\right)\right)=\rho \sigma \tag{3.2.2}
\end{equation*}
$$

This $\rho$ value is critical in understanding the electronic change along the progression of the reaction. If $\rho$ is positive, the reaction is accelerated by electron withdrawing groups and a negative charge is building during the reaction. And when $\rho$ has a negative value, electron donating groups will facilitate the reaction and a positive charge is developed during the reaction.

One interesting feature about $\sigma$ values is that they do not include effects for direct stabilization through resonance. The reason is that $\sigma$ 's are derived from the dissociation of benzoic acid to benzoate, when the negative charge cannot be delocalized by resonance. Therefore, in many reactions that generate charges that can be significantly stabilized by resonant delocalization, $\sigma^{+}$or $\sigma^{-}$can be employed. The $\sigma^{+}$scale was measured by the ionization of para-substituted phenols, and the $\sigma^{-}$scale was collected upon the heterolysis of para-substituted chlorodimethylphenylmethanes (Scheme 3.2.2.2).

Scheme 3.2.2.2. (a) Ionization of substituted phenol for $\sigma^{-}$values; (b) heterolysis of substituted chlorodimethylphenylmethanes for $\sigma^{+}$values.

### 3.3. Results and discussion

### 3.3.1. Electronic effect from $\boldsymbol{\beta}$-aryl groups

We commenced our study by looking at the electronic effects of different substituents on the aryl ring at the $\beta$-position of the enone on the reaction rate. A series of methyl styrenyl ketones were made through Wittig reactions. Their reactions with styrenyl boronic acid catalyzed by BINOL 107 conveniently yielded products without the formation of side products. The reactions were monitored by gas chromatography every five minutes for an hour. The ratio between the integration of the starting enone and that of the corresponding product reflected the percentage of the remaining substrate at a given timepoint. Fortunately, a first order dependence with respect to starting material was observed since the plot of the natural $\log$ of the ratio versus the reaction time gave a completely straight line.

The rate constant corresponding to each substituent, which was the slope of the plot, was then determined (Table 3.3.1). With all the rate constants in hand, we could produce a Hammett plot using $\sigma^{+}$values to define the $\rho$ value (Figure 3.3.1). Indeed, a negative $\rho$
value was obtained, indicating the acceleration of the reaction by electron donating groups. This observation is relatively unusual since electron rich substrates would typically be considered less electrophilic for a nucleophilic attack. Albeit unusual, we find this unsurprising for it correlates to our experimental observation on the greater reactivity of electron rich enones. At this point, the obtained data showed a consistency with the complex formation as the rate determining step because an electron releasing group can give a stronger binding to the boron center and also stabilize the positive charge at the $\beta$ carbon. Therefore, a similar Hammett study on the keto aryl ring would be helpful in confirming the actual slow step.

Table 3.3.1. Reaction rate constants of $\beta$-aryl substrates

Figure 3.3.1. Hammet plot for $\beta$-aryl substitution.

### 3.3.2. Electronic effect from keto aryl groups

A small library of aryl styrenyl ketones was easily synthesized through a three-step synthesis ${ }^{21}$, and the rate constants were also quickly determined (Table 3.3.2). The Hammett plot was again plotted using $\sigma^{+}$values and to our surprise, the opposite result was observed (figure 3.3.2). The plot depicted a straight line with positive slope, expressing a positive rho value and showing that electron donating groups decelerate the reaction. These data are not consistent with the possibility of the complex formation to be rate determining. Thus, the addition step appeared more likely to be rate defining.

Table 3.3.2. Reaction rate constants of keto-aryl substrates

| X | $\sigma+$ | $\mathrm{k}\left(\min ^{-1}\right)$ | logk |
| :---: | :---: | :---: | :---: |
| Br | 0.15 | $9.56 \times 10^{-2}$ | -1.02 |
| H | 0 | $7.44 \times 10^{-2}$ | -1.13 |
| F | -0.07 | $8.40 \times 10^{-2}$ | -1.08 |
| Ph | -0.18 | $10.2 \times 10^{-2}$ | -0.991 |
| Ph | -0.26 | $6.74 \times 10^{-2}$ | -1.17 |
| OMe | -0.78 | $3.32 \times 10^{-2}$ | -1.48 |

Figure 3.3.2. Hammet plot for keto-aryl substitution.

It appears, from the data obtained above, that the reaction rate is strongly dependent on the localization of the cationic charge on the $\beta$-carbon for the carbon-carbon bond formation. In case of the electron donating group on the keto aryl ring, the positive charge on the complex 206 will be delocalized along that ring making the $\beta$-carbon less electrophilic because of cross-conjugation and thus causing a slow reaction (Scheme 3.3.2, from 206 to 207). In addition, when the group on the $\beta$-aryl ring becomes more donating, the cationic charge is more likely to reside on the $\beta$-carbon (208) where the carbon-carbon bond forming occurs, due to stabilization via resonance. Consequently, a faster reaction will be observed.

208
Scheme 3.3.2. Resonance stabilization from aryl groups.

### 3.3.3. Electronic effect from boronic acids

To have stronger support for our proposal of the carbon-carbon bond formation being rate determining, we also investigated the rate dependence on the electronics of the nucleophiles. We anticipated a positive correlation between the electron donating ability
of the substituent and the reaction rate. In fact, this trend was correctly reproduced with higher rate constants for electron donating groups (Table 3.3.3). As depicted in the Hammett plot (Figure 3.3.3), a clear negative rho value was obtained, confirming the slow step to be carbon-carbon formation.

Table 2.3.3. Reaction rate constants from styrenylboronic acids

Figure 3.3.3. Hammet plot for boronic acid aryl substitution.

### 3.4. Conclusion

A deeper insight into the mechanism of the BINOL-catalyzed conjugate addition of alkenylboronic acids to enones was carried out with some success. The work further confirmed the mechanistic pathway proposed by the theoretical study. The Hammett plot analysis on the electronic effects from the $\beta$-aryl, keto aryl and the nucleophile aryl groups reveal the behaviors correlating to the scheme. Furthermore, this Hammett study also gave firm evidence for carbon-carbon bond formation as the rate determining step since it demonstrated the rate dependence on the ability of the aryl groups in the enone to accommodate the cationic charge on the $\beta$-carbon where the bond would be made.

### 3.5. Experimental section

### 3.5.1. General consideration

GC data were recorded on an Agilent 7890B GC with an Agilent 5977A MS detector.
${ }^{1}$ H-NMR spectra were recorded on a JEOL-500 spectrometer with tetramethylsilane as
internal standard in $\mathrm{CDCl}_{3}$ solvent. Chemical shifts were reported in parts per million (ppm, $\delta$ ) and coupling constants are given in Hertz. Proton coupling patterns are described as singlet ( s ), doublet (d), triplet ( t ), and multiplet (m). All reagents were purchased from Sigma-Aldrich and used without further purification. Silica gel (230-400 mesh, Silicycle, Canada) was used for chromatographic separation.

### 3.5.2. General procedure for the synthesis of $(E)$-4-phenylbut-3-en-2-ones from benzaldehydes and Wittig reagent

A 10 ml round bottom flask equipped with a stir bar and a condenser was flame-dried under vacuum and backfilled with argon three times. Benzaldehyde ( 2 mmol ) was then added followed by the addition of 1-(triphenylphosphoranylidene)-2-propanone (1.2 eq, $764 \mathrm{mg})$ and toluene ( 4 ml ). The reaction mixture was heated at reflux for two hours. Product was then purified using silica gel column chromatography with proper eluent.

### 3.5.2.1. Synthesis of ( $E$ )-4-phenylbut-3-en-2-one (209)

See the general procedure for enone formation above. After silica gel chromatography using $5 \%-10 \%$ ethyl acetate in hexanes as eluent, the title compound was obtained in $98 \%$ yield $(286 \mathrm{mg})$ as a white solid. ${ }^{1} \mathrm{H}-\mathrm{NMR}\left(500 \mathrm{MHz}, \mathrm{CDCl}_{3}\right): \delta=7.53(\mathrm{~m}, 3 \mathrm{H}), 7.34$ $(\mathrm{m}, 3 \mathrm{H}), 6.72(\mathrm{~d}, \mathrm{~J}=16.6 \mathrm{~Hz}, 1 \mathrm{H}), 2.38(\mathrm{~s}, 3 \mathrm{H}) .{ }^{13} \mathrm{C}-\mathrm{NMR}\left(125.77 \mathrm{MHz}, \mathrm{CDCl}_{3}\right): \delta=$
198.6, 143.6, 134.5, 133.6, 129.1, 128.4, 127.2, 27. All spectral properties were identical to those reported in the literature. ${ }^{22}$

### 3.5.2.2. Synthesis of ( $E$ )-4-(4-(trifluoromethyl)phenyl)but-3-en-2-one (210)

See the general procedure for enone formation above. After silica gel chromatography using $5 \%-10 \%$ ethyl acetate in hexanes as eluent, the title compound was obtained in $62 \%$ yield ( 264 mg ) as a white solid. ${ }^{1} \mathrm{H}-\mathrm{NMR}\left(500 \mathrm{MHz}, \mathrm{CDCl}_{3}\right): \delta=$ $7.64(\mathrm{~m}, 4 \mathrm{H}), 7.51(\mathrm{~d}, \mathrm{~J}=16 \mathrm{~Hz}, 1 \mathrm{H}), 6.77(\mathrm{~d}, \mathrm{~J}=16 \mathrm{~Hz}, 1 \mathrm{H}), 2.4(\mathrm{~s}, 3 \mathrm{H}) .{ }^{13} \mathrm{C}-\mathrm{NMR}$ (125.77 MHz, $\mathrm{CDCl}_{3}$ ): $\delta=198.0,141.4,129.2,128.4,126.03,126.0,27.9$. All spectral properties were identical to those reported in the literature. ${ }^{23}$

### 3.5.2.3. Synthesis of( $\boldsymbol{E}$ )-4-(4-methoxyphenyl)but-3-en-2-one (211)

See the general procedure for enone formation above. After silica gel chromatography using $20 \%$ ethyl acetate in hexanes as eluent, the title compound was obtained in $81 \%$ yield ( 287 mg ) as a white solid. ${ }^{1} \mathrm{H}-\mathrm{NMR}\left(500 \mathrm{MHz}, \mathrm{CDCl}_{3}\right): \delta=7.48$ $(\mathrm{m}, 3 \mathrm{H}), 6.91(\mathrm{~d}, \mathrm{~J}=9.2 \mathrm{~Hz}, 2 \mathrm{H}), 6.6(\mathrm{~d}, \mathrm{~J}=16 \mathrm{~Hz}, 1 \mathrm{H}), 3.84(\mathrm{~s}, 3 \mathrm{H}), 2.35(\mathrm{~s}, 3 \mathrm{H}) .{ }^{13} \mathrm{C}-$ NMR (125.77 MHz, $\mathrm{CDCl}_{3}$ ): $\delta=198.5,161.7,143.4,131.1,127.1,125.1,114.5,55.5$, 27.5. All spectral properties were identical to those reported in the literature. ${ }^{24}$

### 3.5.2.4. Synthesis of ( $\boldsymbol{E}$ )-4-(biphenyl-4-yl)but-3-en-2-one (212)

After silica gel chromatography using 5-10\% ethyl acetate in hexanes as eluent, the title compound was obtained in $66 \%$ yield ( 296 mg ) as a white solid. ${ }^{1}$ H-NMR ( 500 $\left.\mathrm{MHz}, \mathrm{CDCl}_{3}\right): \delta=7.63(\mathrm{~m}, 6 \mathrm{H}), 7.55(\mathrm{~d}, 16 \mathrm{~Hz}, 1 \mathrm{H}), 7.46(\mathrm{~m}, 2 \mathrm{H}), 7.38(\mathrm{~m}, 1 \mathrm{H}), 6.76(\mathrm{~d}$, $16 \mathrm{~Hz}, 1 \mathrm{H}$ ), $2.4(\mathrm{~s}, 3 \mathrm{H}) .{ }^{13} \mathrm{C}-\mathrm{NMR}\left(125.77 \mathrm{MHz}, \mathrm{CDCl}_{3}\right): \delta=198.5,143.4,143.1,140.2$, $133.4,129.0,128.9,128.0,127.7,127.1,127.07,27.7$. All spectral properties were identical to those reported in the literature. ${ }^{25}$

### 3.5.2.5. Synthesis of ( $E$ )-4-(4-bromophenyl)but-3-en-2-one (213)

After silica gel chromatography using $10 \%$ ethyl acetate in hexanes as eluent, the title compound was obtained in $74 \%$ yield $(332 \mathrm{mg})$ as a white solid. ${ }^{1} \mathrm{H}-\mathrm{NMR}$ (500 $\left.\mathrm{MHz}, \mathrm{CDCl}_{3}\right): \delta=7.53(\mathrm{~d}, 8.6 \mathrm{~Hz}, 2 \mathrm{H}), 7.45-7.39(\mathrm{~m}, 3 \mathrm{H}), 6.69(\mathrm{~d}, 16 \mathrm{~Hz}, 1 \mathrm{H}), 2.37(\mathrm{~s}$, $3 \mathrm{H}) .{ }^{13} \mathrm{C}-\mathrm{NMR}\left(125.77 \mathrm{MHz}, \mathrm{CDCl}_{3}\right.$ ): $\delta=198.2,142.0,133.4,132.3,129.7,127.6,124.9$, 27.8. All spectral properties were identical to those reported in the literature. ${ }^{23}$

### 3.5.3. General procedure for the synthesis of $(\boldsymbol{E})$-chalcones from the corresponding

 benzaldehydes

A 20 ml round bottom flask equipped with a stir bar was flame-dried under vacuum and backfilled with argon. The flask was then charged with 5 ml of THF and benzaldehyde ( 5 mmol ) and cooled in an ice bath. MeMgCl ( 3 M in THF, 2 equiv., 1.3 ml ) was added dropwise to the flask and the reaction was allowed to stir at $0^{\circ} \mathrm{C}$ for one hour. $6 \mathrm{M} \mathrm{HCl}(2.5 \mathrm{ml})$ was then added and the aqueous phase was extracted with ether ( $2 \times 5 \mathrm{ml}$ ). The combined organic extract was dried with $\mathrm{MgSO}_{4}$ and the solvent was removed to give the crude secondary benzylic alcohol which was subjected to the next reaction without further purification.

A 50 ml round bottom flask equipped with a stir bar was charged with 2 g silica gel. The flask was then flame-dried under vacuum and backfilled with argon. Pyridinium dichromate ( 2 equiv., 3.76 g ) was added followed by the addition of 5 ml DCM. A solution of the crude alcohol obtained from previous step in 5 ml DCM was added to the flask and the reaction was allowed to stir for 16 h . The reaction mixture was next passed through a silica gel plug and rinsed with ethyl acetate. The solvent was then removed and the corresponding ketone was purified by column chromatography using appropriate eluent. The product was collected into a 20 ml vial ( 4 dram) and 5 ml of ethanol was added followed by the addition of benzaldehyde (1 equiv) and a stir bar. 2.5 M NaOH (1.2 equiv) was added dropwise to the vial with stirring. The reaction was allowed to stir for one hour and water was then added. The mixture was extracted with DCM ( $3 \times 5 \mathrm{ml}$ ). The organic extracts were combined and dried under $\mathrm{MgSO}_{4}$. The solvent was removed and the crude mixture was recrystallized from ethanol to give the pure product.

### 3.5.3.1. Synthesis of ( $E$ )-1-(4-bromophenyl)-3-phenylprop-2-ene-1-one (214)

See the general procedure for chalcone formation above. The title compound was obtained in $40 \%$ yield ( 580 mg ) over 3 steps as a bright yellow solid. ${ }^{1} \mathrm{H}-\mathrm{NMR}$ ( 500 $\left.\mathrm{MHz}, \mathrm{CDCl}_{3}\right): \delta=7.88(\mathrm{~d}, \mathrm{~J}=8.6 \mathrm{~Hz}, 2 \mathrm{H}), 7.82(\mathrm{~d}, \mathrm{~J}=16 \mathrm{~Hz}, 1 \mathrm{H}), 7.64(\mathrm{~m}, 4 \mathrm{H}), 7.49-$ $7.42(\mathrm{~m}, 4 \mathrm{H}) .{ }^{13} \mathrm{C}-\mathrm{NMR}\left(125.77 \mathrm{MHz}, \mathrm{CDCl}_{3}\right): \delta=189.5,145.5,137,134.8,132.0$, $130.9,130.1,129.1,128.6,128.0,121.5$. All spectral properties were identical to those reported in the literature. ${ }^{26}$

### 3.5.3.2. Synthesis of (E)-1-(4-methoxyphenyl)-3-phenylprop-2-ene-1-one (215)

See the general procedure for chalcone formation above. The title compound was obtained in $40 \%$ yield ( 475 mg ) over 3 steps as a white solid. ${ }^{1} \mathrm{H}-\mathrm{NMR}$ ( 500 MHz , $\left.\mathrm{CDCl}_{3}\right): \delta=8.04(\mathrm{~d}, \mathrm{~J}=9.2 \mathrm{~Hz}, 2 \mathrm{H}), 7.8(\mathrm{~d}, \mathrm{~J}=15.5 \mathrm{~Hz}, 1 \mathrm{H}), 7.64(\mathrm{~m}, 2 \mathrm{H}), 7.55(\mathrm{~d}, \mathrm{~J}=16$ $\mathrm{Hz}, 1 \mathrm{H}), 7.4(\mathrm{~m}, 3 \mathrm{H}), 6.98(\mathrm{~d}, \mathrm{~J}=8.8 \mathrm{~Hz}, 2 \mathrm{H}), 3.88(\mathrm{~s}, 3 \mathrm{H}) .{ }^{13} \mathrm{C}-\mathrm{NMR}(125.77 \mathrm{MHz}$, $\left.\mathrm{CDCl}_{3}\right): \delta=188.8,163.5,144.1,135.2,131.2,130.9,130.4,129.0,128.5,121.9,113.9$, 55.6. All spectral properties were identical to those reported in the literature. ${ }^{27}$

### 3.5.3.3. Synthesis of ( $\boldsymbol{E}$ )-1-(4-bromophenyl)-3-phenylprop-2-ene-1-one (216)

See the general procedure for chalcone formation above. The title compound was obtained in $23 \%$ yield ( 257 mg ) over 3 steps as a white solid. ${ }^{1} \mathrm{H}-\mathrm{NMR}$ ( 500 MHz ,
$\left.\mathrm{CDCl}_{3}\right): \delta=8.06(\mathrm{dd}, \mathrm{J}=8.6 \mathrm{~Hz} ; 5.2 \mathrm{~Hz}, 2 \mathrm{H}), 7.82(\mathrm{~d}, \mathrm{~J}=15.5 \mathrm{~Hz}, 1 \mathrm{H}), 7.64(\mathrm{~m}, 2 \mathrm{H}), 7.51$ $(\mathrm{d}, \mathrm{J}=15.5 \mathrm{~Hz}, 1 \mathrm{H}), 7.42(\mathrm{~m}, 3 \mathrm{H}), 7.17(\mathrm{t}, \mathrm{J}=8.6 \mathrm{~Hz}, 2 \mathrm{H}) .{ }^{13} \mathrm{C}-\mathrm{NMR}(125.77 \mathrm{MHz}$, $\left.\mathrm{CDCl}_{3}\right): \delta=188.9,166.7,164.7,147.2,134.8,134.6,131.23,131.16,130.8,129.1,128.6$, $121.6,115.9,115.8$. All spectral properties were identical to those reported in the literature. ${ }^{28}$

### 3.5.3.4. Synthesis of ( $\boldsymbol{E}$ )-1-(4-tert-butylphenyl)-3-phenylprop-2-ene-1-one (217)

See the general procedure for chalcone formation above. The title compound was obtained in $24 \%(320 \mathrm{mg})$ over 3 steps as a white solid. ${ }^{1} \mathrm{H}-\mathrm{NMR}\left(500 \mathrm{MHz}, \mathrm{CDCl}_{3}\right): \delta=$ $7.98(\mathrm{~d}, \mathrm{~J}=8.6 \mathrm{~Hz}, 2 \mathrm{H}), 7.81(\mathrm{~d}, \mathrm{~J}=16 \mathrm{~Hz}, 1 \mathrm{H}), 7.65(\mathrm{~m}, 2 \mathrm{H}), 7.56-7.52(\mathrm{~m}, 3 \mathrm{H}), 7.42-$ $7.41(\mathrm{~m}, 3 \mathrm{H}), 1.36(\mathrm{~s}, 9 \mathrm{H}) .{ }^{13} \mathrm{C}-\mathrm{NMR}\left(125.77 \mathrm{MHz}, \mathrm{CDCl}_{3}\right): \delta=190.2,156.7$, 144.5, 135.7, 135.1, 130.5, 129.0, 128.6, 128.5, 125.7, 122.2, 35.2, 31.2. All spectral properties were identical to those reported in the literature. ${ }^{28}$

### 3.5.3.5. Synthesis of ( $\boldsymbol{E}$ )-1-(biphenyl-4-yl)-3-phenylprop-2-ene-1-one (218)

The title compound was obtained in $51 \%(732 \mathrm{mg})$ over 3 steps as a yellow solid. ${ }^{1} \mathrm{H}$ NMR ( $500 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ): $\delta=8.21(\mathrm{~d}, \mathrm{~J}=8.6 \mathrm{~Hz}, 2 \mathrm{H}), 7.87(\mathrm{~d}, \mathrm{~J}=16 \mathrm{~Hz}, 1 \mathrm{H}), 7.73(\mathrm{~d}, \mathrm{~J}=$ 8.6 Hz, 2H), 7.68-7.65 (m, 4H), $7.60(\mathrm{~d}, \mathrm{~J}=16 \mathrm{~Hz}, 1 \mathrm{H}), 7.50-7.40(\mathrm{~m}, 6 \mathrm{H}) .{ }^{13} \mathrm{C}-\mathrm{NMR}$ (125.77 MHz, $\left.\mathrm{CDCl}_{3}\right): \delta=190.0,145.6,144.8,140.0,137.0,135.0,130.7,129.3,129.1$,
128.6, 128.4, 127.4, 122.1. All spectral properties were identical to those reported in the literature. ${ }^{29}$

### 3.5.4. General procedure for the Hammet plot study

The reactions were conducted in 2 dram vials equipped with a stir bar and 100 mg of $4 \AA$ molecular sieves: after the vial was charged with the molecular sieves, it was flamedried and backfilled with argon 3 times. The enone ( 0.2 mmol ), BINOL 107 ( 0.2 equiv., 28.7 mg ), styrenylboronic acid (3 equiv., 88.8 mg ), and $\mathrm{Mg}(\mathrm{O} t-\mathrm{Bu})_{2}$ ( 0.1 equiv., 3.4 mg ) were then added followed by the addition of 4 ml toluene. The reaction was allowed to heat at reflux for one hour. 0.2 ml of the reaction solution was extracted via syringe every 5 minutes for GC analysis. The extracted reaction mixture was passed through a short silica gel column (Pasteur pipet) using 1:1 mixture of hexanes and ethyl acetate as the eluent. The collected eluent was then transfer to a GC sample vial and trans-stilbene or (E)-4-phenylbut-3-en-2-one was added as internal standard. The percent of the enone at different time points were calculated from the integration of the peaks for the substrate and the product recorded by the GC.

## Chapter 4

## Enantioselective synthesis of diarylalkane compounds via BINOL-catalyzed conjugate addition

### 4.1. Background

### 4.1.1. Introduction

Like chiral heterocycles, chiral diarylalkane structures have been found in many biologically active natural products. Many of them are also in important pharmaceuticals such as Detrol and Zoloft (Scheme 4.1.1). Some others possess interesting activities that may be applied in the potential treatment of a number of diseases.

Sertraline (Zoloft-Antidepressant) 219

anti-insomnia agent
232

Scheme 4.1.1. Important diarylalkanes

Such important biological activity of bis-aryl compounds has made them a hot topic of many synthetic efforts. In light of the BINOL-catalyzed conjugate addition method that we had established so far, we opted to employ it for the synthesis of different chiral
diarylmethine stereocenters. Therefore, this chapter will discuss the success in using the BINOL chemistry for such goal. It is noteworthy that the method will provide a complementary tool to a wide range of many other methods in the same theme. The next section will cover recent advances for access to chiral diarylalkane compounds, and the literature scope will be limited to carbon-carbon bond formations.

### 4.1.2. Method towards chiral diarylalkanes

### 4.1.2.1. Organometallic transformations

A direct entry to enantioenriched chiral diaryl compounds can be achieved efficiently via the metal-catalyzed coupling of a benzylic electrophile and an organometallic reagent. One prominent method came from the Fu group. In 2005, they reported the nickel catalyzed enantioselective Negishi reaction on racemic secondary benzylic halides using organozinc reagents to obtain alkylated products in good yield and with impressive ee's (Scheme 4.1.2.1.1a). ${ }^{1}$ This work established a strong base for their extension to the use of arylzinc reagents in the synthesis of an array of chiral bis-aryl compounds (Scheme 4.1.2.1.1b). ${ }^{2}$ The great utility of the method was also demonstrated by the preparation of $(S)$-sertraline tetralone, a precursor of Zoloft, a medicine for the treatment of metal disorders (Scheme 4.1.2.1.1c).

Scheme 4.1.2.1.1. Nickel catalyzed coupling reactions between (a) alkylzinc and (b) arylzinc reagents to benzylic electrophiles and (c) application to the synthesis of ( $S$ )setraline tetralone 247.

In 2009, Adrio and Carretero performed the arylation and vinylation of secondary benzylbromides by means of Kumada-Corriu coupling to generate various bis-aryl and vinyl-aryl products. ${ }^{3}$ Although the strategy was primarily non-asymmetric, the reaction executed on enantioenriched substrates showed a high degree of chirality transfer with
over $98 \%$ stereoinversion observed, giving highly optically pure diaryl products (Scheme 4.1.2.1.2).

Scheme 4.1.2.1.2. Palladium catalyzed coupling between an aryl-Grignard reagent and enantioenriched benzylbromide.

In a similar communication on the use of enantioenriched benzylic starting materials for coupling reactions, Watson et al. demonstrated a nickel catalyzed replacement of ammonium ${ }^{4}$ and pivalate groups by a number of aryl entities (Scheme 4.1.2.1.3). ${ }^{5}$ This method allows the utilization of arylboronic acids and arylboroxines as milder nucleophiles than Grignard and organozinc reagents. Because of this fact, the transformation expresses a great functional group tolerance, including ether, amino, fluoro, chloro and acetal groups. The reactions were also proven to occur with overall inversion of configuration.

Scheme 4.1.2.1.3. Nickel catalyzed coupling reaction of (a) enantioenriched benzylammonium and arylboronic acid; (b) enantioenriched benzylpivalate and arylboroxine

The utility of boronate nucleophiles was later re-affirmed by Tekada and Minakata in 2014. ${ }^{6}$ In this communication, they carried out the coupling of arylboronic acids and enantiopure arylaziridines leading to the opening of the ring and the installment of a new aryl group at the benzylic position (Scheme 4.1.2.1.4). The strategy employed an efficient palladium/NHC catalytic system to construct a variety of configurationally defined 2arylphenethylamines, which are difficult targets under traditional routes. Configurational inversion was again observed in all cases tested.

Scheme 4.1.2.1.4. Palladium catalyzed coupling of arylboronic acids and enantioenriched benzylarizidines.

Above were highlighted the methods of the SN-like transformations using aryl nucleophiles and benzylic electrophiles. In the opposite scenario, a coupling between a benzylic nucleophile and an aryl electrophile also provides a powerful tool for the construction of highly configurationally pure bis-aryl structures. An early example is the Suzuki-Miyaura coupling between optically pure secondary benzyl boronic esters and aryl iodides by Crudden and coworkers in 2009. ${ }^{7}$ The reactions proceeded with great chirality transfer and with a retention of configuration (Scheme 4.1.2.1.5).

Scheme 4.1.2.1.5. Suzuki coupling of enantioenriched benzylboronates and aryliodides.

Intrigued by the versatility of enantioenriched organoboronates in coupling reactions, the Morken group developed an elegant method to prepare enantiopure benzylboronates
from racemic geminal bis-boronates. ${ }^{8}$ In the presence of a chiral monodentate taddolderived phosphoramidite ligand, an enantiotopic group selective Suzuki coupling was obtained with inversion in stereochemistry as determined by labelled boron experiments. The reactions advanced in greater yields with aryl iodides than with the bromides, generating highly enantiopure benzylic boronates. The utility of the method was then demostrated in the synthesis of the pharmaceutical ( $R$ )-tolterodine (Detrol LA), a chiral bis-aryl compound used for the treatment of urinary incontinence (Scheme 4.1.2.1.6).

Scheme 4.1.2.1.6. Application of enantiotopic group selective Suzuki reaction in the synthesis of ( $R$ )-tolterodine 230.

One of the traditional ways to construct carbon carbon bonds is the 1,4 -addition reaction. In the context of the synthesis of bis-aryl structures, the rhodium catalyzed conjugate addition of arylboronic acids has also had several major contributions. Since first introduced by Miyaura in 1997, the transformation has developed to a high level of both conversion and selectivity. ${ }^{9}$ However, a literature search reveals fewer examples of acyclic arylenones. An early representative, also by Miyaura, was the enantioselective addition to $\alpha, \beta$-unsaturated esters using ( $S$ )-BINAP as the chiral ligand for rodium complex. ${ }^{10}$ A variety of enone substrates were examined giving moderate to high yields
and good selectivities. Nevertheless, aryl enones were shown to perform poorly with lower enantiomeric excesses than alkyl enones (Scheme 4.1.2.1.7).

Scheme 4.1.2.1.7. Rhodium catalyzed asymmetric conjugate addition of arylboronic acid to $\beta$-aryl $\alpha, \beta$-unsaturated esters.

An improvement came from the use of $\alpha, \beta$-unsaturated sulfones. The work was done by Carretero and coworkers in 2004. ${ }^{11}$ The pyridyl sulfone group on the substrates was believed to cause a metal-chelating effect that improved the reactivity. In fact, under their standard conditions, the reactions of styrenyl sulfone substrates with arylboronic acids happened smoothly with good yields and selectivities (Scheme 4.1.2.1.8).

Scheme 4.1.2.1.8. Rhodium catalyzed asymmetric conjugate addition of arylboronic acids to $\beta$-aryl $\alpha, \beta$-unsaturated sulfones.

In the same year, in an effort to design an efficient [2.2.2]-diene ligand for the $\mathrm{Rh}(\mathrm{I})$ catalyzed conjugate addition reactions of the substrates that were not widely examined at the time, Carreira et al. were able to obtain the addition of an arylboronic acid to phenylenone with moderate yield and good selectivity (Scheme 4.1.2.1.9). ${ }^{12}$ This result, albeit being the only example, demonstrated the applicability of rhodium catalyzed 1,4-addition to produce chiral diaryl compounds from acylic aryl-enones.

Scheme 4.1.2.1.9. Rhodium catalyzed asymmetric conjugate addition of arylboronic acid to acylic $\beta$-aryl enone.

One year later, in 2005, the Carreira group documented an enantioselective addition of arylboronic acids to aryl-enal substrates using their diene ligand. ${ }^{13}$ It is worth mentioning that this strategy allows the use of strongly electron deficient arylboronic acids in high yielding reactions with great enantioselectivities (Scheme 4.1.2.1.10).

Scheme 4.1.2.1.10. Rhodium catalyzed asymmetric conjugate addition of arylbornic acids to $\beta$-aryl enals.

In terms of aryl-enone reactivity, it is worth highlighting the work of Lautens and coworkers in 2013. ${ }^{14}$ In this communication, they developed a tandem one-pot procedure to synthesize nonracemic chiral $\beta$-disubstituted ketones, including diaryl compounds. The transformation goes through the sequence of gold-catalyzed Meyer-Schuster rearrangement of a starting propargylic alcohol and enatioselective rhodium catalyzed conjugate addition of boronic acids to the newly formed enones. The reactions proceeded nicely with yields up to $97 \%$ over two steps and enantiomeric excesses up to $96 \%$ (Scheme 4.1.2.1.11).

Scheme 4.1.2.1.11. Tandem one-pot synthesis of diaryl ketones.

One of the challenging substrates in terms of stereoselectivity for this type of chemistry is the nitroalkenes. In fact, the Hayashi group were able to obtain high selectivities for the asymmetric addition of boronic acids to cyclic aliphatic enones in $2000 .{ }^{15}$ In many reports after, low levels of enantiomeric enrichment were observed with acylic $\beta$-aryl nitroalkene substrates. ${ }^{16}$ It was not until 2010 when Lin and coworkers made use of their $\mathrm{C}_{2}$-symmetric chiral bicyclo[3.3.0] ligand 287 that a considerable improvement could be achieved. ${ }^{17}$ It is noteworthy that the employment of $\mathrm{KHF}_{2}$ in conjunction with arylboronic acids is crucial for the desired selectivity (Scheme 4.1.2.1.12).

Scheme 4.1.2.1.12. Rhodium catalyzed conjugate addition of arylboronic acids to 2arylnitroalkenes.

Shortly after, in 2011, Liao et al. introduced their tert-butanesulfinylphosphine structure 291 as an excellent ligand to obtain the same level of selectivity as Lin's system. ${ }^{18}$ The synthesis of $(R)$-cherylline 294 was also disclosed to demonstrate the synthetic applicability of the method (Scheme 4.1.2.1.13).

Scheme 4.1.2.1.13. tert-butanesulfinylphosphine ligand in rhodium catalyzed conjugate addition of arylboronic acids to nitroalkenes and application in the synthesis of ( $R$ )-cherylline 294.

An additional ligand system is the olefin-sulfone ligands introduced by the Wan group in 2012. ${ }^{19}$ With this new type of ligand, they were able to obtain a broad scope of substrates including aryl, alkyl and heteroaryl nitroalkenes with good yields and selectivities (Scheme 3.1.2.1.14).

Scheme 3.1.2.1.14. Olefin-sulfoxide ligand for rhodium catalyzed conjugate addition of arylbornic acids to nitroalkenes.

### 4.1.2.2. Organocatalytic methods

Organocatalysts allow the use of mild reagents which are helpful to achieve a broad functional group tolerance. However, it is because of such mildness that those reagents sometimes do not possess enough reactivity for the targets of interest. The iminium activation strategy, employed by MacMillan group, was shown to facilitate the FriedelCrafts alkylation of arenes by electron-deficient olefins to form different enantioenriched diarylalkanes with good yield and great ee's. ${ }^{20}$ Nonetheless, only electron rich aromatic compounds could be used (Scheme 4.1.2.2.1).

Scheme 4.1.2.2.1. Iminium catalysis in the conjugate addition of electron-rich benzenes to $\alpha, \beta$-unsaturated aldehydes.

The low reactivity of neutral reagents can be compensated for by applying harsh conditions, typically via elevated temperature. Chong's arylation of aromatic enones using a BINOL-based catalyst required the reactions to operate at $120^{\circ} \mathrm{C}$ in the presence of excess arylboronic ester, which also functioned as the solvent. ${ }^{21}$ The high temperature provided enough energy for the transformation to occur. However, it decreased the selectivity to some extent (Scheme 4.1.2.2.2). In addition, the necessity of liquid arylboronic esters greatly narrows the scope of the nucleophile.

Scheme 4.1.2.2.2. BINOL-catalyzed conjugate addition of arylbornic esters to chalcones.

An additional solution for the insufficient reactivity of neutral systems can come from the use of high energy substrates, as an alternative to the employment of reactive nucleophiles by MacMillan described above. In 2012, Schaus and coworkers documented their usage of o-quinone methides as the electrophilic counterpart for the addition of aryl and akenylboronic esters to afford a variety of optically pure diarylmethine products (Scheme 4.1.2.2.3a). ${ }^{22}$ It is the strong propensity of the $o$-quinone methides to rearomatize that plays as the driving force for a smooth transformation under mild
conditions. The Schaus group also showed the application of hydroxybenzyl ethyl ether substrates, which can generate $o$-quinone methides in situ that in turn will be trapped by the addition of boronates (Scheme 4.1.2.2.3b). This is considered to be a solution to access a wider range of $o$-quinone methides that are difficult to isolate. A limitation is the requirement of an ortho hydroxyl group on the aryl ring.

Scheme 4.1.2.2.3. BINOL-catalysis in (a) conjugate addition of arylbornic esters to vinyl $o$-quinone methides and (b) alkenylation of hydroxybenzyl alcohols.

### 4.2. Approach

In an effort to develop a method for the synthesis of chiral bis-hetrocycles, Jiun-le Shih in the May lab was able to acquire efficient conditions in which potassium trifluoroborates were used in place of boronic acids and the reactions could proceed without the presence of any additive (Scheme 4.2.1). Trifluoroborates are known for their
great stability and ease of handling. Furthermore, they exhibited greater reactivity and consistency than the corresponding boronic acids. In light of this accomplishment, we envisaged that aryltrifluoroborate salts would be efficient for obtaining bis-aryl structures.

Scheme 4.2.1. BINOL-catalyzed conjugate addition of heteroaryltrifluoroborates to $\beta$-aryl-enones.

It is engrossing to understand how the trifluoroborate salts can work in conjuction with BINOL catalysts for the asymmetric conjugate addition to enones. Another valuable fact from Shih's work is that the stereochemistry of the products, which were elucidated by X-ray analysis, is in great agreement with the enantiomeric induction that has been established so far for the use of boronic esters and acids. From this, we believe that trifluoroborates should go through a similar process which initially involves the formation of an activated trivalent BINOL-derived boronate species. In order for the trifluoroborate to have such interaction with BINOL, we postulate that a fluoride must dissociate from the parent trifluoroborate to form the trivalent difluoroboronate 315,
which in turn condenses with the BINOL catalyst to give rise to the active species $\mathbf{3 1 6}$ or 317 (Scheme 4.2.2). This postulate was supported by experimental evidence obtained by Shih

Scheme 4.2.2. Proposed mechanism of the BINOL-catalyzed conjugate addition of aryltrifluoroborates to enones.

### 4.3. Reaction optimization

Our starting point was to test the potential of the transformation. Therefore, with the use of potassium phenyltrifluoroborate we chose the highly electron rich substrate $\mathbf{1 3 5}$, which was believed to have great reactivity. Table 4.3.1 summarizes our attempts to enhance the reaction outcome.

Table 4.3.1. Reaction development with potassium phenyltrilfuoroborate

| Entry | BINOL ( $20 \mathrm{~mol} \%$ ) | Additive | Solvent | T ${ }^{\circ} \mathrm{C}$ | Time (h) | Yield (\%) | er |

107

As illustrated in the table, Shih's conditions that work so excellently in the bisheterocyclic stereocenter synthesis give no reaction (entry 1). Different parameters, including the catalyst, additive, solvent and temperature, were examined, with the best yield at $20 \%$ (entry 6). Despite the low conversion, the outstanding enantiomeric ratio (98:2 er) indicated a potential highly selective transformation. At this point, we decided to turn our attention to more electron rich nucleophiles with the hope to gain greater reactivity. At the same time, we switched to substrate 326, which is a more practical structure since the methylenedioxybenzene moiety is present in a number of bioactive
molecules. To begin, we opted to use potassium 4-methoxyphenyltrifluoroborate to serve for the reaction optimization (Table 4.3.2).

Table 4.3.2. Reaction development with 4-methoxyphenyltrifluoroborate

| Entry | Additive | Time (h) | Yield (\%) | er |
| :---: | :---: | :---: | :---: | :---: |
| 1 | 4 A MS | 48 | 15 | N.D. |

| 4 | $\mathrm{LiBr}(1 \mathrm{eq})$ | 48 | 86 | $99: 1$ |
| 5 | $\mathrm{LiCl}(1 \mathrm{eq})$ | 48 | 53 | N.D. |
| 6 | $\mathrm{Lil}(1 \mathrm{eq})$ | 48 | 10 | N.D. |
|  |  |  | reaction turned black |  |
| 7 | $\mathrm{MgBr}_{2} . \mathrm{Et}_{2} \mathrm{O} \mathrm{(1} \mathrm{eq)}$ | 43 | 14 | N.D. |
| 8 | $\mathrm{NaBr}(3 \mathrm{eq})$ | 24 | 0 | N.D. |
| 9 | $\mathrm{NaI}(3 \mathrm{eq})$ | 24 | 0 | N.D. |

The bis-heterocycle conditions were again tested, giving a 15\% yield after 48 hours (entry 1). It is noteworthy that all the heterocyclic nucleophiles employed in that work are electron rich, and mechanistically we believe that the fluoride dissociation occurs more spontaneously in those reagents than in aryltrifluoroborates. Therefore, a stronger fluoride dissociating agent than molecular sieves was sought to help increase the concentration of the trivalent difluoroarylboronate, which is more active toward BINOL. To our delight, the addition of 3 equivalents of LiBr proved to accelerate the reaction, and the yield was boosted to $77 \%$ in only 15 hours (entry 2 ). This phenomenon is understandable, since fluoride dissociation would form LiF, which is thermodynamically
more favored than that of $\mathrm{KF}^{23}$ and can drive the equilibrium forward. As it turned out, the molecular sieves could be omitted when LiBr is in use (entry 3) although with a lower yield due to the formation of side products. This problem can be alleviated by decreasing the amount of LiBr to 1 equivalent (entry 4 ). The reaction proceeds more slowly but affords more of the desired product in $86 \%$. Excellent enantioselectivity (99:1 er) was also achieved. LiCl appeared to be less effective (entry 5). The use of LiI caused serious decomposition presumably, due to the in situ formation of reactive iodine (entry 6). Magnesium and sodium salts were demonstrated to be not as effective as lithium additives. With optimal conditions in hand (entry 4), we carried the study on the scope of the reaction.

### 4.4. Reaction scope

### 4.4.1. Aryltrifluoroborate scope

Using the substrate from the optimization process, we examined a variety of electron rich aryltrifluoroborate salts (Table 4.4.1). To our delight, all the nucleophiles under examination gave high yields with excellent selectivities.

Table 4.4.1. Reactions of electron rich aryltrifluoroborates

${ }^{\mathrm{a}} 4$ Å MS used instead of LiBr

It is noteworthy that a para-amino group is electronically sufficient for the fluoride dissociation, so the reaction requires only molecular sieves to proceed (entry 3). An interesting feature is that the reagents bearing ortho donating groups react more rapidly than the para-subsituted reagents (entry 1 vs. entry 4 ; entry 2 vs. entry 5). This implies a possible proximal electronic stabilization of the transition state by the ortho donating group. Other ortho substituted aryltrifluoroborates react smoothly under the given conditions (entry 4-11). These results show the advantage of the strategy over the typical Friedel-Crafts reactions, which rarely get functionalized at the ortho position, especially
with bulky substituents. It is worth mentioning that the presence of an additional electron withdrawing group beside an electron donating one does not have a negative effect on the reaction outcome (entry 11). Finally, methyl groups provide adequate electron density to afford an efficient reaction (entry 10).

### 4.4.2. Aryl enone scope

With the success of expanding the scope of nucleophiles, we continued to different aromatic enones. To serve this purpose, we chose the potassium 2benzyloxyphenyltrifluoroborate $\mathbf{3 3 9}$ as the nucleophile because of its availability as well as of the removability of the benzyl group (Table 4.4.2). As expected, a wide range of enones possessing different electronic natures were shown to be compatible.

Table 4.4.2. Scope of aryl enones

It is interesting that not only do the electron rich substrates give good results (entry 78), but the electron deficient enones do also (entry 2-6; entry 9). The high reactivities of the halogenated substrates (entry 2-6) are important, for those groups are well known for their great functionalizability. A phenolic substrate also proved compatible to give a considerably selective reaction albeit in moderate yield (entry 11).

### 4.5. Conclusion

A highly enantioselective conjugate addition of potassium aryltrifluoroborates to $\beta$ -aryl-enones was established to obtain a broad collection of optically pure bis-aryl compounds. The reactions require the aid of LiBr to effectively dissociate one fluoride from the trifluoroborate in order to be operable in BINOL catalysis. It is important that the nucleophiles be electron rich. That requirement, however, is inapplicable to the electrophiles since enones of all electronic nature are demonstrated to react under the standard conditions.

### 4.6. Experimental section

### 4.6.1. General consideration

All reactions were carried out in flame- or oven-dried glassware. THF, toluene and $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ were purged with argon and dried over activated alumina columns. Flash chromatography was performed on $60 \AA$ silica gel (EMD Chemicals Inc). Preparative plate chromatography was performed on EMD silica gel plates, $60 \AA$, with UV-254 indicator. Chemical names were generated using Cambridge Soft ChemBioDraw Ultra 12.0. Analysis by HPLC was performed on a Shimadzu Prominence LC (LC-20AB) equipped with a SPD-20A UV-Vis detector and a Chiralpak or Chiralcel ( $250 \mathrm{~mm} \times 4.6$ mm ) column (see below for column details). Analytical thin layer chromatography was
performed on EMD silica gel/TLC plates with fluorescent detector 254 nm . The ${ }^{1} \mathrm{H},{ }^{13} \mathrm{C}$ and ${ }^{19}$ F NMR spectra were recorded on a JEOL ECA-500 or ECX-400P spectrometer using residual solvent peak as an internal standard $\left(\mathrm{CDCl}_{3}: 7.24 \mathrm{ppm}\right.$ for ${ }^{1} \mathrm{H}$ NMR and 77.00 ppm for ${ }^{13} \mathrm{C}$ NMR). Hexafluorobenzene ( $\delta=-164.9 \mathrm{ppm}$ ) was employed as an external standard in ${ }^{19}$ F NMR spectra. HRMS analyses were performed under contract by UT Austin's mass spectrometric facility via ESI method and a US10252005 instrument.

### 4.6.2. General procedure for the synthesis of starting material (enone)

To a flask equipped with a stir bar and a condenser was added carboxaldehyde (2 mmol ), 1-(triphenylphosphoranylidene)-2-propanone ( 1.2 equiv, 764 mg ), and toluene (4 $\mathrm{ml})$. The reaction mixture was refluxed for 1-2 h. After completion, the reaction mixture was concentrated via rotary evaporation. The crude mixture was purified via flash column chromatography with an appropriate eluent on silica gel.

### 4.6.2.1. Synthesis of $(\boldsymbol{E})$-4-(benzo[d][1,3]dioxol-5-yl)but-3-en-2-one (326)

See general procedure for enone formation above. 5 mmol of corresponding aldehyde was used. After silica gel chromatography using $10 \%-20 \%$ ethyl acetate in hexanes as eluent, the title compound was obtained in $95 \%$ yield ( 364 mg ) as a white solid. ${ }^{1} \mathrm{H}$ NMR ( $500 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ): $\delta=7.41(\mathrm{~d}, J=16.6 \mathrm{~Hz}, 1 \mathrm{H}), 7.03-7.00(\mathrm{~m}, 2 \mathrm{H}), 6.81(\mathrm{~d}, \mathrm{~J}=8.0 \mathrm{~Hz}$, $1 \mathrm{H}), 6.54(\mathrm{~d}, J=16.0 \mathrm{~Hz}, 1 \mathrm{H}), 6.00(\mathrm{~s}, 2 \mathrm{H}), 2.34(\mathrm{~s}, 3 \mathrm{H}) .{ }^{13} \mathrm{C} \mathrm{NMR}(125.77 \mathrm{MHz}$,

### 4.6.3. General procedure for potassium aryltrifluoroborate synthesis

Following a procedure by Molander and coworkers, ${ }^{28}$ arylboronic acid ( 5 mmol ) was added to a reaction flask containing 10 ml diethyl ether at room temperature. The potassium hydrogendifluoride ( 2.8 equiv, 1.09 g ) was then added to the suspension followed by the addition of water ( 4.5 ml ) over 30 minutes. The reaction was allowed to stir vigorously in 3 hours. After 3 hours, the reaction mixture was concentrated and dissolved in hot acetone. The solution was then filtered and concentrated. The residue was again dissolved in hot acetone and the product was then precipitated upon the addition of diethyl ether. Finally, the pure product was collected by suction filtration.

### 4.6.3.1. Synthesis of potassium (4-methoxyphenyl)trifluoroborate, precursor to 328

See general procedure for trifluoroborate formation above. The title compound was obtained in $98 \%$ yield $(1.0569 \mathrm{~g})$ as a white solid. ${ }^{1} \mathrm{H}$ NMR ( 400 MHz, DMSO- $\mathrm{d}_{6}$ ): $\delta=$ $7.18(\mathrm{~d}, J=8.2 \mathrm{~Hz}, 2 \mathrm{H}), 6.60(\mathrm{~d}, J=8.2 \mathrm{~Hz}, 2 \mathrm{H}), 3.59(\mathrm{~s}, 3 \mathrm{H}) .{ }^{13} \mathrm{C}$ NMR ( 100 MHz ,

DMSO-d ${ }_{6}$ ): $\delta=157.3,132.3,111.9,54.6 .{ }^{19}$ F NMR (470.6 MHz, DMSO-d $\mathrm{d}_{6}$ ): $\delta=-140.5$. ${ }^{11}$ B-NMR (160.4 MHZ, DMSO-d $\mathrm{d}_{6}$ : $\delta=$ 2.30. HRMS (ESI) $\mathrm{m} / \mathrm{z}$ : calculated for $\mathrm{C}_{7} \mathrm{H}_{7} \mathrm{BF}_{3} \mathrm{O}$ 175.0549, found 175.0547. All spectral properties were identical to those reported in the literature. ${ }^{29}$

### 4.6.3.2. Synthesis of potassium (4-methylthiophenyl)trifluoroborate, precursor to

 329

See general procedure for trifluoroborate formation above. The title compound was obtained in $90 \%$ yield $(1.0326 \mathrm{~g})$ as a white solid. ${ }^{1} \mathrm{H}$ NMR ( 500 MHz, DMSO-d $\left.\mathrm{d}_{6}\right): \delta=$ $7.27(\mathrm{~d}, J=8.0 \mathrm{~Hz}, 2 \mathrm{H}), 7.03(\mathrm{~d}, J=8.0 \mathrm{~Hz}, 2 \mathrm{H}), 2.40(\mathrm{~s}, 3 \mathrm{H}) .{ }^{13} \mathrm{C}$ NMR ( 125.77 MHz , DMSO-d $\mathrm{d}_{6}$ ): $\delta=133.3,132.0,125.1,15.4 .{ }^{19}$ F NMR ( 470.6 MHz, DMSO-d $\mathrm{d}_{6}$ ): $\delta=-141.3$. ${ }^{11}$ B NMR (160.4 MHZ, DMSO- $\mathrm{d}_{6}$ ): $\delta=2.29$. HRMS (ESI) m/z: calculated for $\mathrm{C}_{7} \mathrm{H}_{7} \mathrm{BF}_{3} \mathrm{~S}$ 191.0320, found 191.0317. All spectral properties were identical to those reported in the literature. ${ }^{30}$
4.6.3.3. Synthesis of potassium (2-methylthiophenyl)trifluoroborate, precursor to 332

See general procedure for trifluoroborate formation above. 6 mmol of the corresponding boronic acid was used. The title compound was obtained in $65 \%$ yield
$(897.7 \mathrm{mg})$ as a white solid. ${ }^{1} \mathrm{H}$ NMR ( $\left.500 \mathrm{MHz}, \mathrm{DMSO}_{\mathrm{d}}^{6}\right): ~ \delta=7.34(\mathrm{~d}, J=6.3 \mathrm{~Hz}$, $1 \mathrm{H}), 7.05(\mathrm{~d}, J=7.4 \mathrm{~Hz}, 1 \mathrm{H}), 6.96(\mathrm{~d}, J=7.4 \mathrm{~Hz}, 1 \mathrm{H}), 6.87(\mathrm{t}, J=7.4 \mathrm{~Hz}, 1 \mathrm{H}), 2.27(\mathrm{~s}$, $3 \mathrm{H}) .{ }^{13} \mathrm{C}$ NMR ( $125.77 \mathrm{MHz}, \mathrm{DMSO}_{6}$ ) $: \delta=141.5,132.07,132.05,126.2,122.5,122.4$, 14.8. ${ }^{19}$ F NMR (470.6 MHz, DMSO-d $\mathrm{d}_{6}$ ): $\delta=-139.4 .{ }^{11}$ B NMR (160.4 MHZ, DMSO-d $\mathrm{d}_{6}$ ): $\delta=6.75 . \operatorname{HRMS}(\mathrm{ESI}) \mathrm{m} / \mathrm{z}$ : calculated for $\mathrm{C}_{7} \mathrm{H}_{7} \mathrm{BF}_{3} \mathrm{~S}$ 191.0320, found 191.0319

### 4.6.3.4. Synthesis of potassium (2,3-dimethoxyphenyl)trifluoroborate, precursor to

 333

See general procedure for trifluoroborate formation above. The title compound was obtained in $96 \%$ yield $(1.1706 \mathrm{~g})$ as a white solid. ${ }^{1} \mathrm{H}$ NMR ( $400 \mathrm{MHz}, \mathrm{DMSO}-\mathrm{d}_{6}$ ): $\delta=$ $6.93(\mathrm{~d}, J=7.3 \mathrm{~Hz}, 1 \mathrm{H}), 6.80(\mathrm{t}, J=7.3 \mathrm{~Hz}, 1 \mathrm{H}), 6.72(\mathrm{~d}, J=7.3 \mathrm{~Hz}, 1 \mathrm{H}), 3.70(\mathrm{~s}, 3 \mathrm{H})$, $3.60(\mathrm{~s}, 3 \mathrm{H}) .{ }^{13} \mathrm{C}$ NMR ( 100 MHz, DMSO-d $\left.\mathrm{d}_{6}\right): \delta=151.8,151.6,125.5,122.5,110.5,59.8$, 55.2. ${ }^{19}$ F NMR (470.6 MHz, DMSO- $\mathrm{d}_{6}$ ): $\delta=-138.7 .{ }^{11}$ B NMR (160.4 MHZ, DMSO-d $\mathrm{d}_{6}$ ): $\delta=$ 2.21. HR MS (ESI) m/z: calculated for $\mathrm{C}_{8} \mathrm{H}_{9} \mathrm{BF}_{3} \mathrm{O}_{2}$ 205.0655, found 205.0652

### 4.6.3.5. Synthesis of potassium (2-phenoxyphenyl)trifluoroborate, precursor to 334

See general procedure for trifluoroborate formation above. 4.67 mmol of the corresponding boronic acid was used. The title compound was obtained in $81 \%$ yield $(930.1 \mathrm{mg})$ as a white solid. ${ }^{1} \mathrm{H}$ NMR ( $\left.500 \mathrm{MHz}, \mathrm{DMSO}-\mathrm{d}_{6}\right): \delta=7.48(\mathrm{dd}, J=7.4 \mathrm{~Hz}$;
$1.7 \mathrm{~Hz}, 1 \mathrm{H}), 7.23(\mathrm{~m}, 2 \mathrm{H}), 7.07(\mathrm{td}, J=7.4 \mathrm{~Hz} ; 1.7 \mathrm{~Hz}, 1 \mathrm{H}), 6.93(\mathrm{~m}, 2 \mathrm{H}), 6.78(\mathrm{~d}, J=$ 8.0 Hz, 2H), $6.62(\mathrm{~d}, J=7.4 \mathrm{~Hz}, 1 \mathrm{H}) .{ }^{13} \mathrm{C}$ NMR (125.77 MHz, DMSO-d ${ }_{6}$ ): $\delta=159.7$, 158.9, 134.2, 129.1, 127.0, 122.6, 120.7, 119.2, 117.5. ${ }^{19} \mathrm{~F}$ NMR (470.6 MHz, DMSO$\left.\mathrm{d}_{6}\right): \delta=-139.3 .{ }^{11} \mathrm{~B}$ NMR (160.4 MHZ, DMSO- $\mathrm{d}_{6}$ ): $\delta=1.96$. HRMS (ESI) $\mathrm{m} / \mathrm{z}$ : calculated for $\mathrm{C}_{12} \mathrm{H}_{9} \mathrm{BF}_{3} \mathrm{O}$ 237.0706, found 237.0709

### 4.6.3.6. Potassium (2-benzyloxyphenyl)trifluoroborate, precursor to 335

See general procedure for trifluoroborate formation above. The title compound was obtained in $85 \%$ yield $(1.2321 \mathrm{~g})$ as a white solid. ${ }^{1} \mathrm{H}$ NMR ( 400 MHz, DMSO- $\mathrm{d}_{6}$ ): $\delta=$ $7.54(\mathrm{~d}, J=7.3 \mathrm{~Hz}, 2 \mathrm{H}), 7.35(\mathrm{~m}, 3 \mathrm{H}), 7.26(\mathrm{t}, J=7.3 \mathrm{~Hz}, 1 \mathrm{H}), 7.00(\mathrm{td}, J=7.3 \mathrm{~Hz} ; 1.8$ $\mathrm{Hz}, 1 \mathrm{H}), 6.72(\mathrm{~m}, 2 \mathrm{H}), 5.02(\mathrm{~s}, 2 \mathrm{H}) .{ }^{13} \mathrm{C}$ NMR ( 100 MHz, DMSO- $\mathrm{d}_{6}$ ): $\delta=161.4$, 138.9, $133.4,128.0,126.9,126.8,126.5,119.5,111.6,68.7 .{ }^{19} \mathrm{~F}$ NMR (470.6 MHz, DMSO-d $\mathrm{d}_{6}$ : $\delta=-139.2 .{ }^{11}$ B NMR (160.4 MHZ, DMSO- $\mathrm{d}_{6}$ ): $\delta=2.23$. HRMS (ESI) $\mathrm{m} / \mathrm{z}$ : calculated for $\mathrm{C}_{13} \mathrm{H}_{11} \mathrm{BF}_{3} \mathrm{O}$ 251.0863, found 251.0860. All spectral properties were identical to those reported in the literature. ${ }^{31}$
4.6.3.7. Synthesis of potassium (2-isopropoxyphenyl)trifluoroborate, precursor to 336

See general procedure for trifluoroborate formation above. 6.15 mmol of the corresponding boronic acid was used. The title compound was obtained in $97 \%$ yield $(1.452 \mathrm{~g})$ as a white solid. ${ }^{1} \mathrm{H}$ NMR ( 400 MHz, DMSO-d $\left.\mathrm{d}_{6}\right): \delta=7.33(\mathrm{~d}, J=5.9 \mathrm{~Hz}, 1 \mathrm{H})$, $6.99(\mathrm{~m}, 1 \mathrm{H}), 6.69(\mathrm{~m}, 2 \mathrm{H}), 4.41(\mathrm{sep}, J=5.9 \mathrm{~Hz}, 1 \mathrm{H}), 1.19(\mathrm{~d}, J=5.9 \mathrm{~Hz}, 6 \mathrm{H}) .{ }^{13} \mathbf{C}$ NMR (100 MHz, DMSO- $\mathrm{d}_{6}$ ): $\delta=161.0,133.87,133.84,126.4,119.6,115.0,69.8,22.4$.
${ }^{19}$ F NMR (470.6 MHz, DMSO-d ${ }_{6}$ ): $\delta=-138.7 .{ }^{11}$ B NMR (160.4 MHZ, DMSO-d ${ }_{6}$ ): $\delta=$ 2.11. HRMS (ESI) m/z: calculated for $\mathrm{C}_{9} \mathrm{H}_{11} \mathrm{BF}_{3} \mathrm{O}$ 203.0862, found 203.0865

### 4.6.3.8. Synthesis of potassium (2,3-dimethylphenyl)trifluoroborate, precursor to

 337

See general procedure for trifluoroborate formation above. The title compound was obtained in $99 \%$ yield $(1.05 \mathrm{~g})$ as a white solid. ${ }^{1} \mathrm{H}$ NMR ( 500 MHz, DMSO-d $\mathrm{d}_{6}$ ): $\delta=$ $7.18(\mathrm{dd}, J=6.5 \mathrm{~Hz} ; 1.4 \mathrm{~Hz}, 1 \mathrm{H}), 6.81-6.76(\mathrm{~m}, 2 \mathrm{H}), 2.20(\mathrm{~s}, 3 \mathrm{H}), 2.12(\mathrm{~s}, 3 \mathrm{H}) .{ }^{13} \mathrm{C}$ NMR (125.77 MHz, DMSO-d $\mathrm{d}_{6}$ ): $\delta=139.0,133.8,129.6,126.7,123.3,20.3,17.9 .{ }^{19} \mathrm{~F}$ NMR (470.6 MHz, DMSO-d 6 $_{6}$ : $\delta=-138.4 .{ }^{11}$ B NMR (160.4 MHZ, DMSO-d ${ }_{6}$ ): $\delta=2.3$. HRMS (ESI) $\mathrm{m} / \mathrm{z}$ : calculated for $\mathrm{C}_{8} \mathrm{H}_{9} \mathrm{BF}_{3}$ 173.0756, found 173.0750
4.6.3.9. Synthesis of potassium (2-methoxy-5-chlorophenyl)trifluoroborate, precursor to 338

See general procedure for trifluoroborate formation above. The title compound was obtained in $97 \%$ yield $(1.2079 \mathrm{~g})$ as a white solid. ${ }^{1} \mathrm{H}$ NMR ( $\left.500 \mathrm{MHz}, \mathrm{DMSO}-\mathrm{d}_{6}\right): \delta=$ $7.20(\mathrm{~d}, J=2.8 \mathrm{~Hz}, 1 \mathrm{H}), 7.03(\mathrm{dd}, J=8.6 \mathrm{~Hz} ; 3.4 \mathrm{~Hz}, 1 \mathrm{H}), 6.69(\mathrm{~d}, J=8.6 \mathrm{~Hz}, 1 \mathrm{H}), 3.61$ (s, 3H). ${ }^{13} \mathrm{C}$ NMR (125.77 MHz, DMSO- $\mathrm{d}_{6}$ ): $\delta=161.1,132.63,132.61,125.9,123.4$, 111.3, 55.0. ${ }^{19} \mathrm{~F}$ NMR (470.6 MHz, DMSO-d $\mathrm{d}_{6}$ ): $\delta=-140.1 .{ }^{11} \mathrm{~B}$ NMR (160.4 MHZ, DMSO- $\mathrm{d}_{6}$ ): $\delta=1.29$. HRMS (ESI) m/z: calculated for $\mathrm{C}_{7} \mathrm{H}_{6} \mathrm{BClF}_{3} \mathrm{O}$ 209.0159, found 209.0159

### 4.6.4. Procedure for catalyst synthesis

### 4.6.4.1. Synthesis of ( $R$ )-2,2'-bis(methoxymethoxy)-1,1'-binaphthyl

See chapter 1 for detail
4.6.4.2. Synthesis of (R)-2,2'-bis(methoxymethoxy)-3,3'-bis(2,3,5,6-tetrafluoro-4-(trifluoromethyl)phenyl)-1,1'-binaphthyl

Title compound was prepared following the procedure previously described in the literature with modifications. ${ }^{32}$ To a flame-dried flask equipped with a magnetic stirbar was added $(R)$-2,2'-bis(methoxymethoxy)-1,1'-binaphthyl ( $1.1091 \mathrm{~g}, 2.96 \mathrm{mmol}, 1$ equiv) and 24 ml THF. The reaction mixture was then cooled down to $0{ }^{\circ} \mathrm{C}$ followed by the addition of $2.5 \mathrm{M} n-\mathrm{BuLi}(3.6 \mathrm{ml}, 8.88 \mathrm{mmol}, 3$ equiv) and allowed to stir in 2 hours. The reaction temperature was decreased to $-78{ }^{\circ} \mathrm{C}$ and perfluorotoluene $(2.9 \mathrm{ml}, 20.72 \mathrm{mmol}$, 7 equiv) was added dropwise via syringe. The reaction mixture was then warmed up to R.T. and stirred at this temperature for 12 h . After completion, the reaction was quenched with saturated aq. $\mathrm{NH}_{4} \mathrm{Cl}$, extracted with $\mathrm{Et}_{2} \mathrm{O}$, and wash with brine. After the removal of solvents via rotary evaporation, the reaction mixture was purified by column chromatography on silica gel using 2-5\% ethyl acetate in hexanes as eluent. The product was obtained as a white solid ( $2.0971 \mathrm{~g}, 2.6 \mathrm{mmol}, 88 \%$ yield) and the spectral data agreed with the reported data.
4.6.4.3. Synthesis of (R)-3,3'-bis(2,3,5,6-tetrafluoro-4-(trifluoromethyl)phenyl)-1,1'-binaphthyl-2,2'-diol (107)

To MOM-protected BINOL ( $2.0971 \mathrm{~g}, 2.6 \mathrm{mmol}$ ) was added MeOH ( 8 mL ) and THF $(8 \mathrm{~mL})$. Amberlyst 15 resin ( 4 g ) was then added and reaction allowed to reflux at $65^{\circ} \mathrm{C}$
for 12 h . After completion, the resin was filtered off and the organic layer concentrated to reduce solvent amount. The organic layer was then passed through a silica plug with 2$5 \%$ ethyl acetate in hexanes as eluent to afford the hydrolyzed product. (1.774 g, 2.47 $\mathrm{mmol}, 95 \%$ yield) and the spectral data agreed with the reported data. ${ }^{32}$

### 4.6.5. General procedure for the BINOL-catalyzed conjugate addition of potassium aryltrifluoroborate to ( $\boldsymbol{E}$ )-4-aryl-3-buten-2-one

To a 2 dram vial equipped with a stir bar was added $\mathrm{LiBr}(1$ equiv, 8.7 mg ) and the flask was flamed-dried under high vacuum. The flask was then back-filled with Argon. The aryl-enone ( $0.1 \mathrm{mmol}, 1.0$ equiv), potassium aryltrifluoroborate (3 equiv), and ( $R$ )$3,3{ }^{\prime}-\left(\mathrm{C}_{7} \mathrm{~F}_{7}\right)_{2}$-BINOL 107 ( $0.02 \mathrm{mmol}, 0.2$ equiv, 14.3 mg ) were then added. Freshly dried toluene ( 4 mL ) was added and the reaction was heated to $111^{\circ} \mathrm{C}$ and allowed to stir at this temperature (see each product for specific reaction times). After completion, the crude reaction mixture was then loaded onto silica gel and purified via flash column chromatography on silica gel with appropriate eluents. (See each product for specific eluent)

### 4.6.5.1. Synthesis of 4-(benzo[d][1,3]dioxo-5-yl)-4-(4-methoxyphenyl)butan-2-one

 (328)

See general procedure for conjugate addition reaction above. The crude reaction mixture was purified via flash column chromatography with $100 \%$ dichloromethane as the eluent. HPLC Chiralpak ID (hexane/i-PrOH $=90: 10,0.75 \mathrm{~mL} / \mathrm{min}$, UV-254 detector). Trial 1: $25.5 \mathrm{mg}, 0.085 \mathrm{mmol}, 82 \%$ yield; $99: 1 \mathrm{er}$ ( $48 \mathrm{~h}, 19.7 \mathrm{mg}$ of starting material). Trial 2: $26.8 \mathrm{mg}, 0.089 \mathrm{mmol}, 89 \%$ yield; $99: 1 \mathrm{er}(48 \mathrm{~h}, 19.2 \mathrm{mg}$ of starting material). ${ }^{1} \mathrm{H}$ NMR $\left(400 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta=7.11(\mathrm{~d}, J=8.7 \mathrm{~Hz}, 2 \mathrm{H}), 6.81(\mathrm{~d}, J=8.7 \mathrm{~Hz}$, $2 \mathrm{H}), 6.68(\mathrm{~m}, 3 \mathrm{H}), 5.88(\mathrm{~s}, 2 \mathrm{H}), 4.44(\mathrm{t}, J=7.8 \mathrm{~Hz}, 1 \mathrm{H}), 3.75(\mathrm{~s}, 3 \mathrm{H}), 3.08(\mathrm{app} . \mathrm{d}, J=$ $7.8 \mathrm{~Hz}, 2 \mathrm{H}), 2.07(\mathrm{~s}, 3 \mathrm{H}) .{ }^{13} \mathrm{C}$ NMR (100 MHz, $\left.\mathrm{CDCl}_{3}\right) \delta=207.0,158.0,147.7,145.9$, $138.1,136.0,128.4,120.3,113.9,108.15,108.12,100.8,55.1,49.9,44.9,30.6$. IR (neat): $2899,1712,1608,1509,1484,1438,1358,1243,1177,1033,923,806 \mathrm{~cm}^{-1}$. HRMS (CI) m/z: calculated for $\mathrm{C}_{18} \mathrm{H}_{18} \mathrm{O}_{4} 298.1205$, found 298.1206

### 4.6.5.2. Synthesis of 4-(benzo[d][1,3]dioxo-5-yl)-4-(4-methylthiophenyl)butan-2-one

 (329)

See general procedure for conjugate addition reaction above. The crude reaction mixture was purified via flash column chromatography with $100 \%$ dichloromethane as the eluent. HPLC Chiralpak ID (hexane/i-PrOH $=90: 10,0.75 \mathrm{~mL} / \mathrm{min}, \mathrm{UV}-254$ detector). Trial 1: $24.7 \mathrm{mg}, 0.078 \mathrm{mmol}, 77 \%$ yield; $99: 1 \mathrm{er}$ ( $46 \mathrm{~h}, 19.5 \mathrm{mg}$ of starting material). Trial 2: $23.3 \mathrm{mg}, 0.074 \mathrm{mmol}, 72 \%$ yield; $99: 1 \mathrm{er}(46 \mathrm{~h}, 19.5 \mathrm{mg}$ of starting material). ${ }^{1} \mathrm{H}$ NMR ( $400 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta=7.16(\mathrm{dd}, J=6.4 \mathrm{~Hz} ; 1.8 \mathrm{~Hz}, 2 \mathrm{H}), 7.11(\mathrm{dd}, J=$ $6.6 \mathrm{~Hz} ; 1.8 \mathrm{~Hz}, 2 \mathrm{H}), 6.68(\mathrm{~m}, 3 \mathrm{H}), 5.89(\mathrm{~s}, 2 \mathrm{H}), 4.45(\mathrm{t}, J=7.3 \mathrm{~Hz}, 1 \mathrm{H}), 3.09(\mathrm{app} . \mathrm{d}, J=$ $7.3 \mathrm{~Hz}, 2 \mathrm{H}), 2.43(\mathrm{~s}, 3 \mathrm{H}), 2.08(\mathrm{~s}, 3 \mathrm{H}) .{ }^{13} \mathrm{C} \operatorname{NMR}\left(100 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta=206.7$, 147.7, $146.0,140.8,137.6,136.2,127.9,126.9,120.4,108.2,108.1,100.9,49.6,45.0,30.6$, 15.9. IR (neat): $2919,1712,1598,1485,1438,1357,1227,1158,1094,1035,1014,924$, $805 \mathrm{~cm}^{-1}$. HRMS (CI) m/z: calculated for $\mathrm{C}_{18} \mathrm{H}_{18} \mathrm{O}_{3} \mathrm{~S}$ 314.0977, found 314.0976.

### 4.6.5.3. Synthesis of 4-(benzo[d][1,3]dioxo-5-yl)-4-(4-dimethylaminophenyl)butan-2one

See general procedure for conjugate addition reaction above. The crude reaction mixture was purified via flash column chromatography with $20 \%$ ethyl acetate in hexanes as the eluent. HPLC Chiralpak ID (hexane $/ \mathrm{i}-\mathrm{PrOH}=95: 5,0.75 \mathrm{~mL} / \mathrm{min}$, UV-254 detector). Trial 1: $31.1 \mathrm{mg}, 0.099 \mathrm{mmol}, 94 \%$ yield; $98: 2$ er ( $3 \mathrm{~h}, 20.3 \mathrm{mg}$ of starting material, 50 mg of $4 \AA$ molecular sieves was used in place of LiBr ). Trial 2: 29.4 mg ,
$0.094 \mathrm{mmol}, 93 \%$ yield; $97: 3 \mathrm{er}(3 \mathrm{~h}, 19.3 \mathrm{mg}$ of starting material, 50 mg of $4 \AA$ molecular sieves was used in place of LiBr$) .{ }^{1} \mathrm{H} \operatorname{NMR}\left(400 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta=7.06(\mathrm{~d}, \mathrm{~J}=$ $9.1 \mathrm{~Hz}, 2 \mathrm{H}), 6.69-6.63(\mathrm{~m}, 5 \mathrm{H}), 5.88(\mathrm{~s}, 2 \mathrm{H}), 4.40(\mathrm{t}, J=7.8 \mathrm{~Hz}, 1 \mathrm{H}), 3.08(\mathrm{app} . \mathrm{d}, J=$ $7.8 \mathrm{~Hz}, 2 \mathrm{H}), 2.89(\mathrm{~s}, 6 \mathrm{H}), 2.07(\mathrm{~s}, 3 \mathrm{H}) .{ }^{13} \mathrm{C}$ NMR ( $100 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta=207.8$, 149.1, 147.6, 145.7, 138.6, 131.7, 128.0, 120.3, 112.7, 108.1, 108.0, 100.8, 50.0, 44.9, 40.6, 30.6. IR (neat): 2884, 1710, 1608, 1519, 1481, 1434, 1342, 1242, 1193, 1163, 1123, 938, $829,812 \mathrm{~cm}^{-1}$. HRMS (CI) m/z: calculated for $\mathrm{C}_{19} \mathrm{H}_{21} \mathrm{NO}_{3} 311.1521$, found 311.1515

### 4.6.5.4. Synthesis of 4-(benzo[d][1,3]dioxo-5-yl)-4-(2-methoxyphenyl)butan-2-one

 (331)

See general procedure for conjugate addition reaction above. The crude reaction mixture was purified via flash column chromatography with $10-20 \%$ ethyl acetate in hexanes as the eluent. HPLC Chiralcel OD-H (hexane/i-PrOH $=90: 10,0.75 \mathrm{~mL} / \mathrm{min}$, UV-254 detector). Trial 1: $29.4 \mathrm{mg}, 0.098 \mathrm{mmol}, 92 \%$ yield ( $15 \mathrm{~h}, 20.3 \mathrm{mg}$ of starting material). Trial 2: $25.7 \mathrm{mg}, 0.086 \mathrm{mmol}, 86 \%$ yield; $99: 1$ er ( $15 \mathrm{~h}, 19.0 \mathrm{mg}$ of starting material). Trial 3: $27.6 \mathrm{mg}, 0.092 \mathrm{mmol}, 92 \%$ yield; $99: 1 \mathrm{er}(15 \mathrm{~h}, 19.1 \mathrm{mg}$ of starting material). ${ }^{1} \mathrm{H}$ NMR ( $400 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta=7.17(\mathrm{td}, J=7.8 \mathrm{~Hz} ; 1.8 \mathrm{~Hz}, 1 \mathrm{H}), 7.08(\mathrm{dd}, J=$ $7.8 \mathrm{~Hz} ; 1.8 \mathrm{~Hz}, 1 \mathrm{H}), 6.88(\mathrm{td}, J=7.8 \mathrm{~Hz} ; 0.9 \mathrm{~Hz}, 1 \mathrm{H}), 6.83(\mathrm{~d}, J=8.2 \mathrm{~Hz}, 1 \mathrm{H}), 6.71(\mathrm{~m}$, $3 \mathrm{H}), 5.88(\mathrm{~s}, 2 \mathrm{H}), 4.89(\mathrm{t}, J=7.8 \mathrm{~Hz}, 1 \mathrm{H}), 3.80(\mathrm{~s}, 3 \mathrm{H}), 3.12(\mathrm{dd}, J=16.0 \mathrm{~Hz} ; 8.2 \mathrm{~Hz}$, $1 \mathrm{H}), 3.05(\mathrm{dd}, J=16.0 \mathrm{~Hz} ; 7.3 \mathrm{~Hz}, 1 \mathrm{H}), 2.09(\mathrm{~s}, 3 \mathrm{H}) .{ }^{13} \mathrm{C}$ NMR $\left(100 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta=$
$207.3,156.5,147.4,145.7,137.3,132.1,127.58,127.55,120.7,120.5,110.7,108.5$, $108.0,100.7,55.3,49.0,39.0,30.2$. IR (neat): 2921, 1712, 1598, 1485, 1437, 1356, 1240, 1159, 1111, 1034, 923, 808, $751 \mathrm{~cm}^{-1}$. HRMS (CI) m/z: calculated for $\mathrm{C}_{18} \mathrm{H}_{18} \mathrm{O}_{4}$ 298.1205, found 298.1206.

### 4.6.5.5. Synthesis of 4-(benzo[d][1,3]dioxo-5-yl)-4-(2-methylthiophenyl)butan-2-one

 (332)

See general procedure for conjugate addition reaction above. The crude reaction mixture was purified via flash column chromatography with $100 \%$ dichloromethane as the eluent. HPLC Chiralcel OD-H (hexane/i-PrOH $=90: 10,0.75 \mathrm{~mL} / \mathrm{min}, \mathrm{UV}-254$ detector). Trial 1: $30.4 \mathrm{mg}, 0.097 \mathrm{mmol}, 96 \%$ yield ( $15 \mathrm{~h}, 19.2 \mathrm{mg}$ of starting material). Trial 2: $30.9 \mathrm{mg}, 0.098 \mathrm{mmol}, 97 \%$ yield; $98: 2 \mathrm{er}(15 \mathrm{~h}, 19.3 \mathrm{mg}$ of starting material).
